# Stability Measurement of 3 CSOs with Tracking DDSs and Two-Sample COV

C. E. Calosso<sup>1</sup>, F. Vernotte<sup>2,3</sup>, V. Giordano<sup>2,3</sup>, C. Fluhr<sup>4</sup>, B. Dubois<sup>4</sup>, E. Rubiola<sup>1,2,3</sup>

1 INRiM, Torino, Italy,

2 Besançon Observatory, France

3 FEMTO-ST Institute, France,

4 FEMTO Engineering, France

## Motivations and Outline

### 10 GHz CSOs

- $2 \times 10^{-16} \dots 10^{-15}$  ADEV at  $1 \dots 10^5$  s
- Not tested at 100 MHz

### TDDS

- $2 \times 10^{-14}/\tau$  ADEV at 100 MHz
- Statistical limit?

### Statistics

- Scalable
- Challenging instrument and oscillators

Let's put all things together and play

<http://rubiola.org><sup>1</sup>

# Liquid-He Sapphire Oscillator

Cr<sup>3+</sup> Fe<sup>3+</sup> doped  
Al<sub>2</sub>O<sub>3</sub> mono crystal  
 $\phi \approx 5$  cm,  $H \approx 3$  cm  
10 GHz resonance  
 $Q \approx 2 \times 10^9$  at 5–7 K

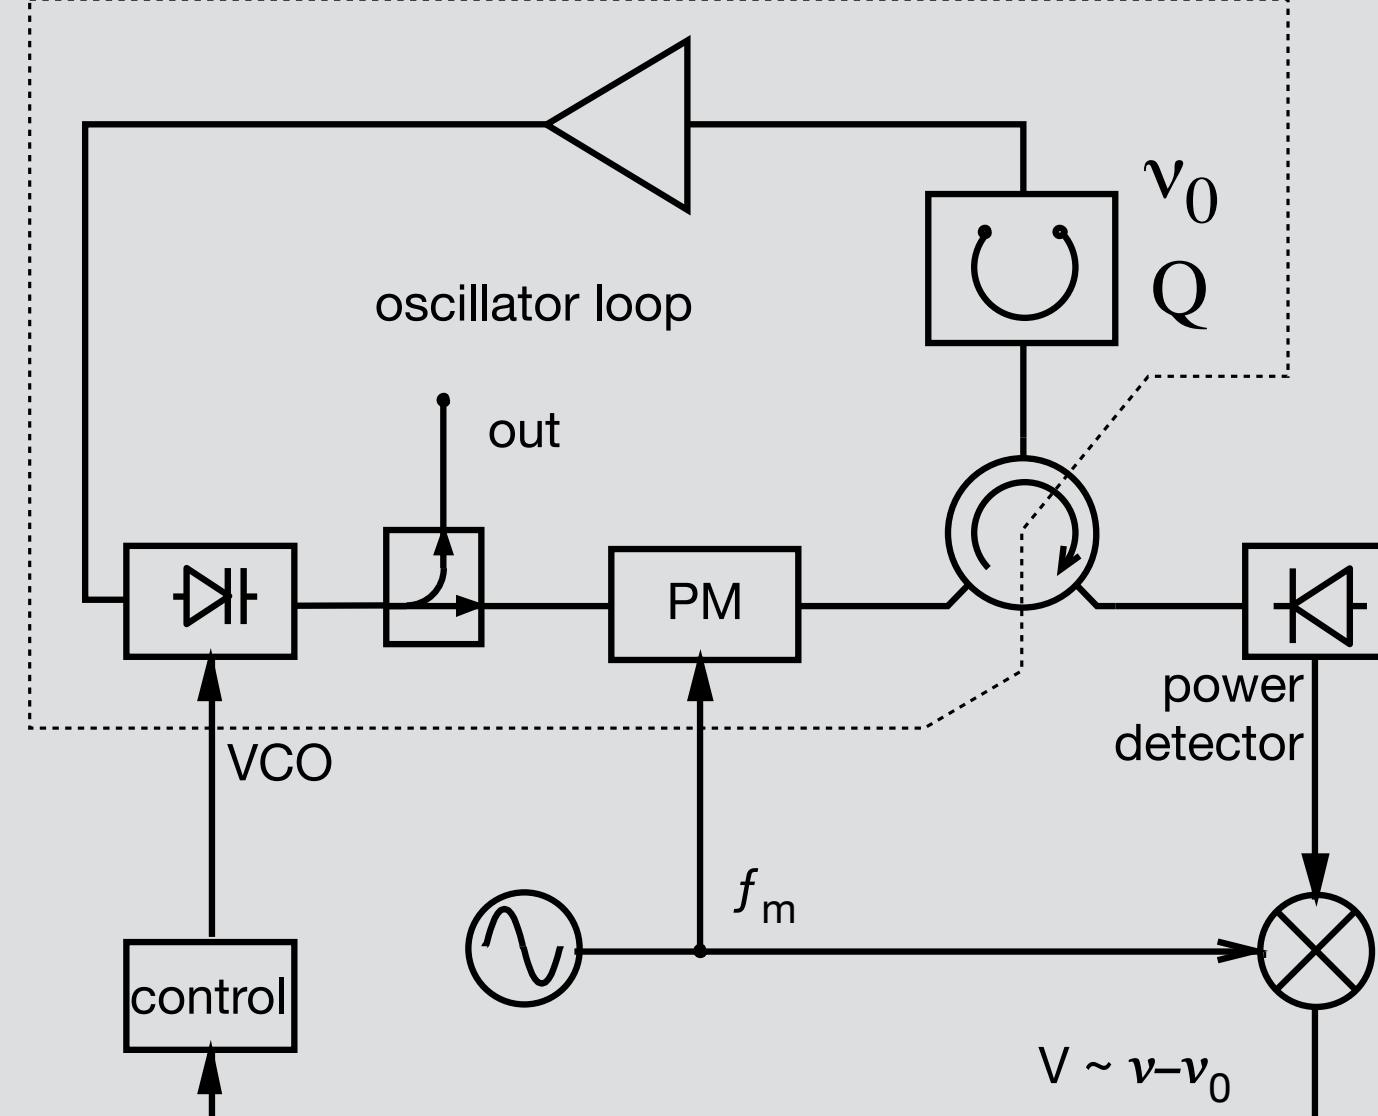

Paramagnetic temperature  
compensation

WGH<sub>16,0,0</sub> mode at 11.565 GHz

## Pound-Galani Oscillator

- Pound frequency lock to the cavity
- The same cavity is used in the VCO

- 3 units in Besancon (one is transportable, stability & noise validated after roundtrip)
- Others: 1 at ESA, Malargue, 3 at a US GOV lab
- $\mu$ Hz-resolution synthesis

# Mechanical & Thermal Engineering

Low-vibe cryogenerator  
< 2 μm displacement @ 1Hz

Low acceleration sensitivity

$$\frac{1 \Delta v}{\gamma v} \sim 3.2 \times 10^{-10} /g$$

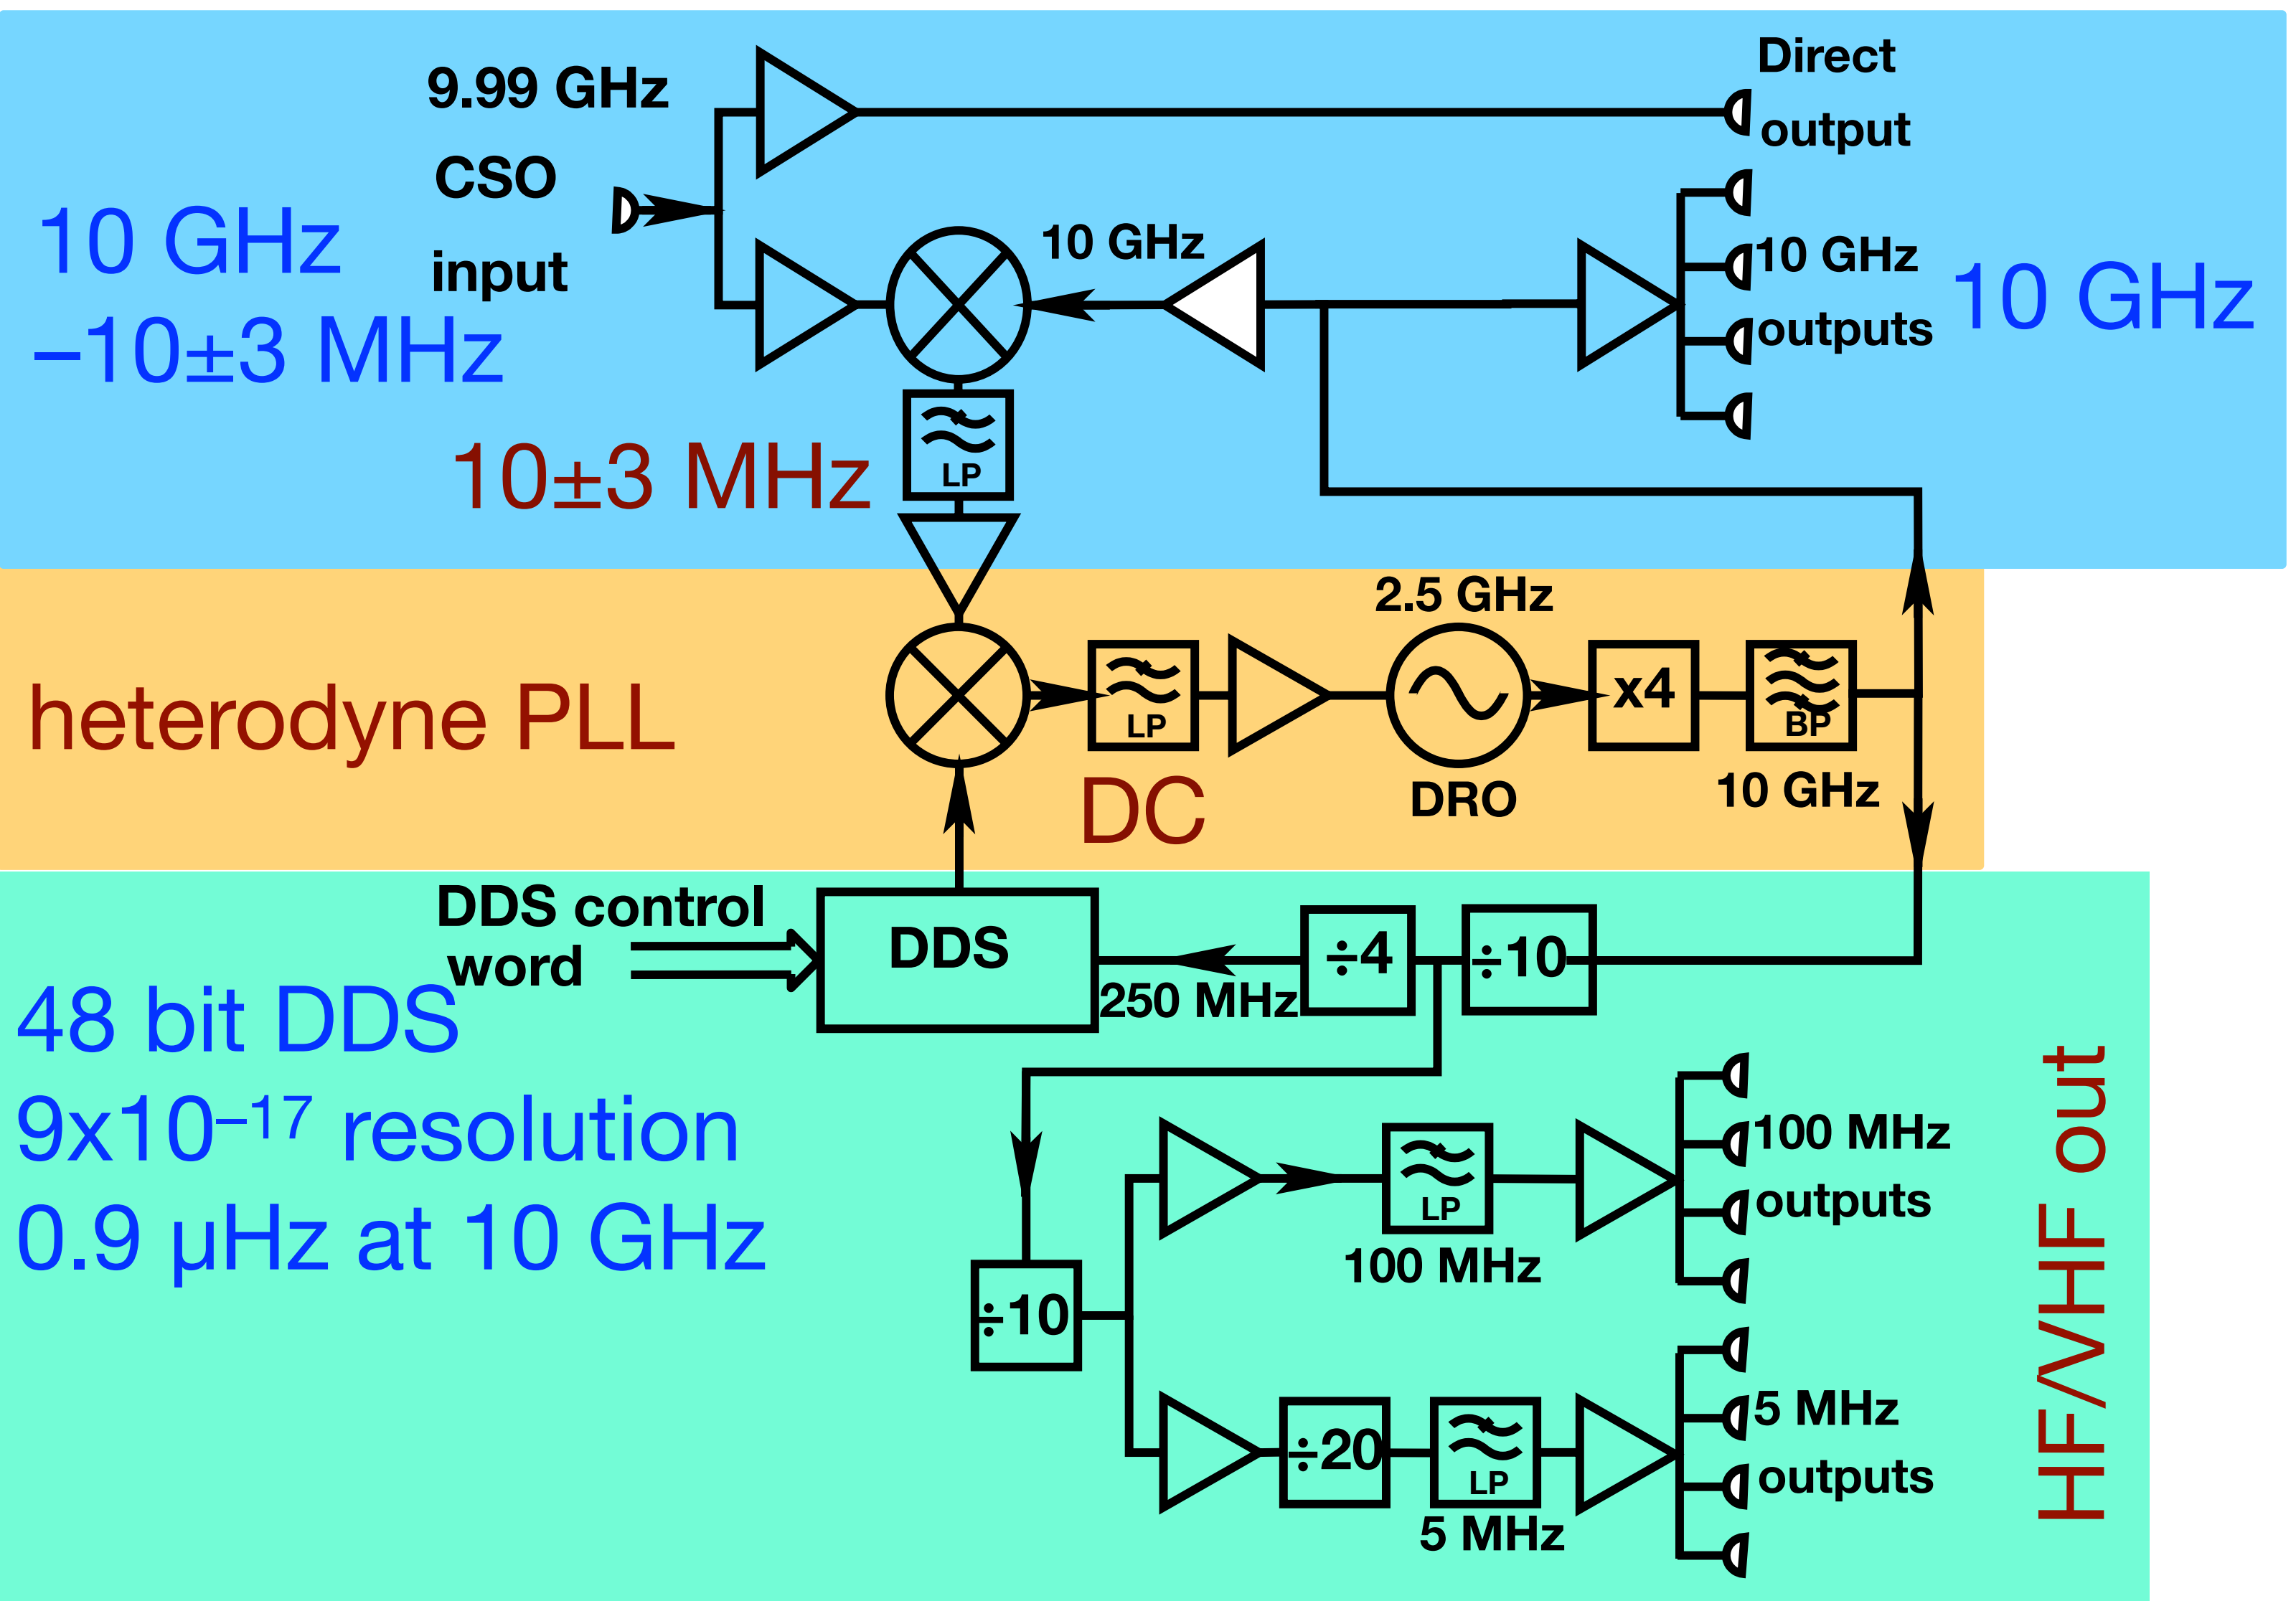

Thermal ballast  
Cold finger temperature stability 100 mK pk

First generation: 6kW three-phase  
Current generation: 3 kW mono-phase

# Frequency Synthesis

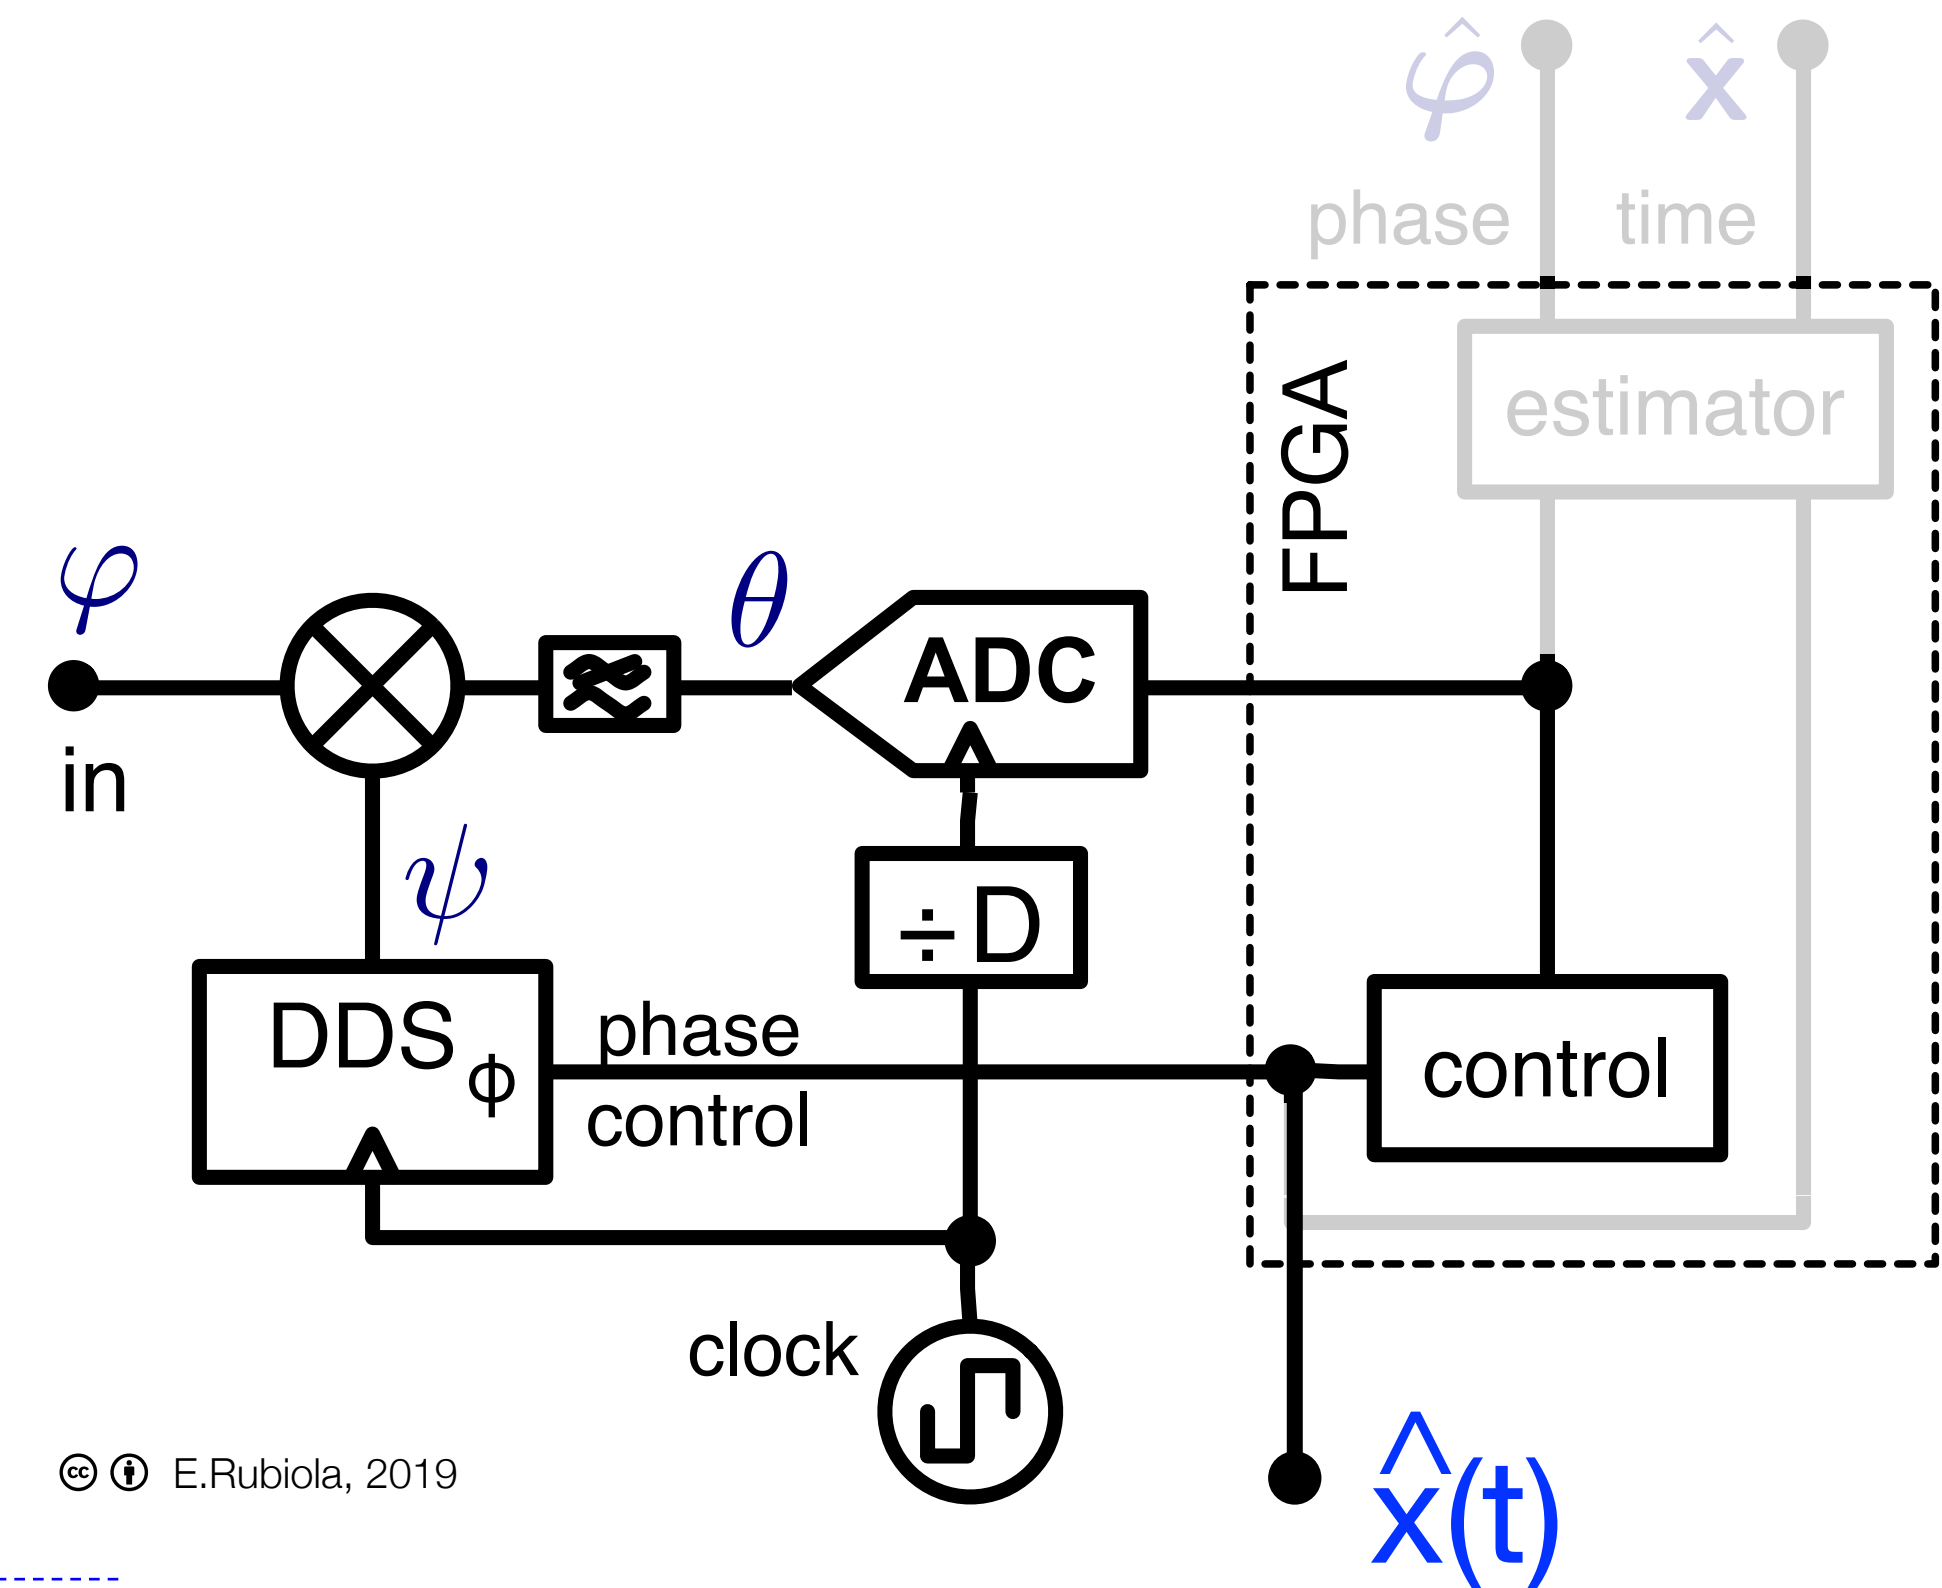

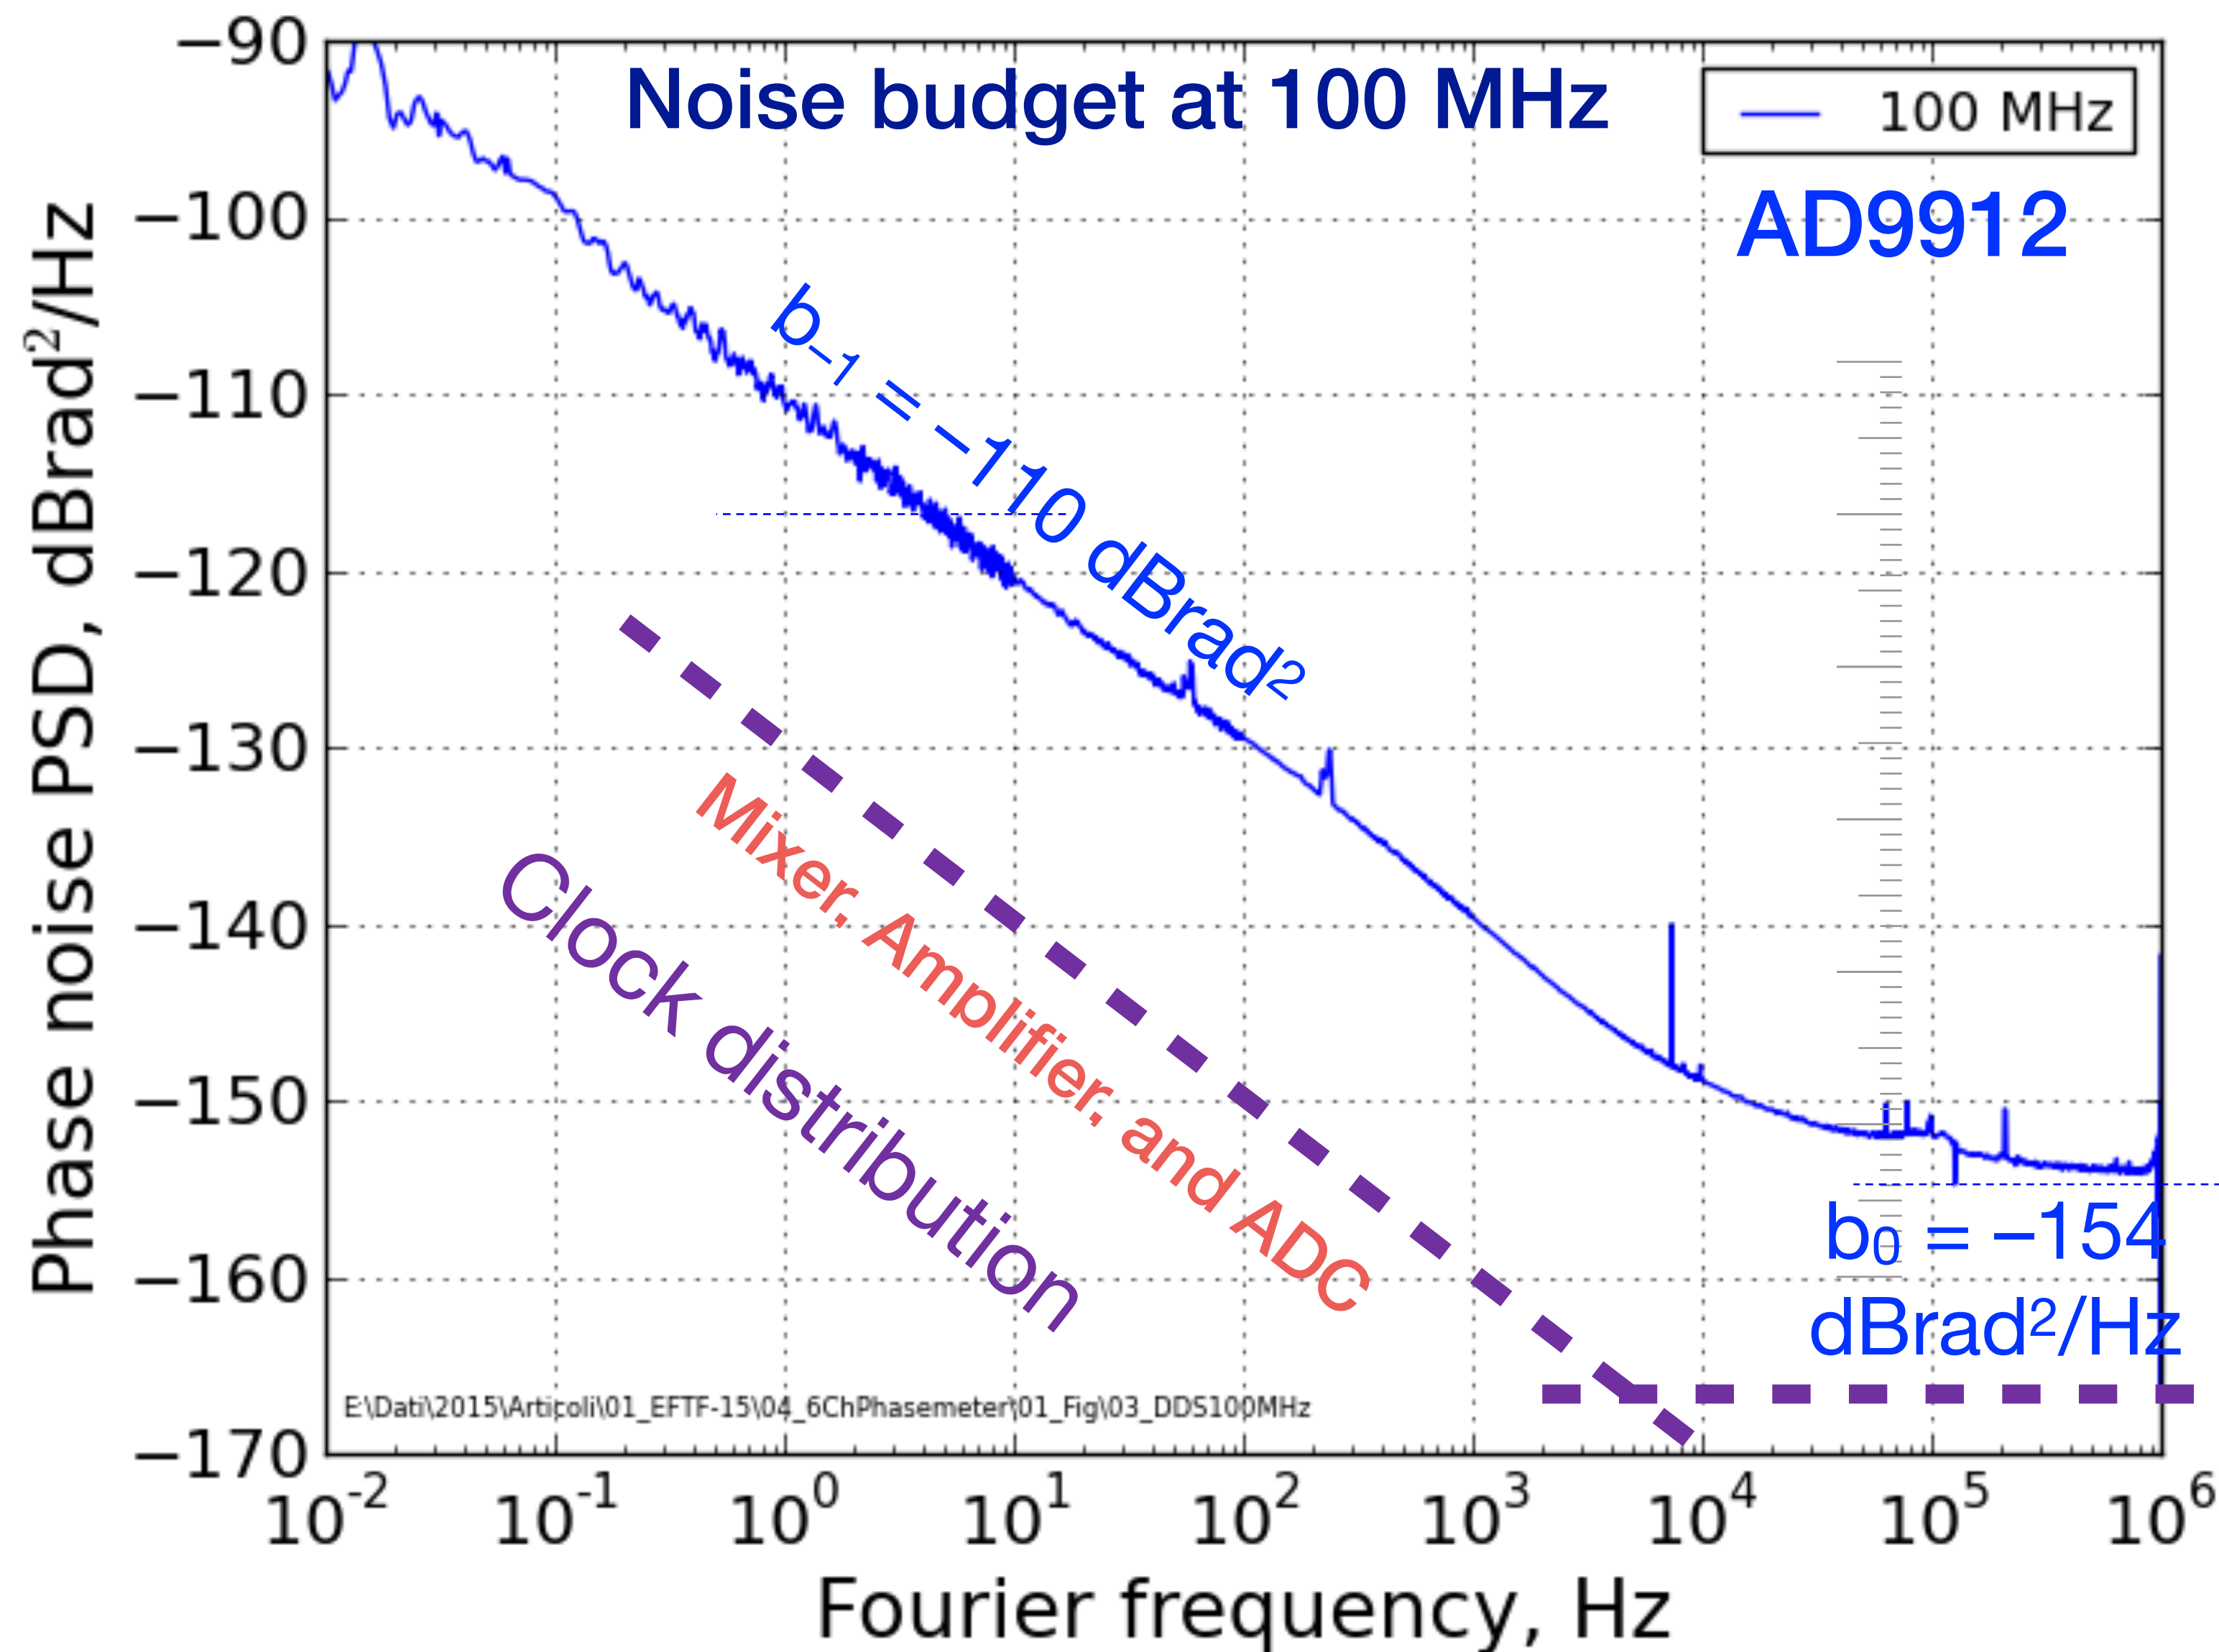

## Key points

- Resonator engineering  
10 GHz – 10 MHz ±3 MHz
- Small frequency offset  
DDS is OK
- Uneven frequencies  
No crosstalk

# Tracking DDS $\rightarrow$ Digital PLL

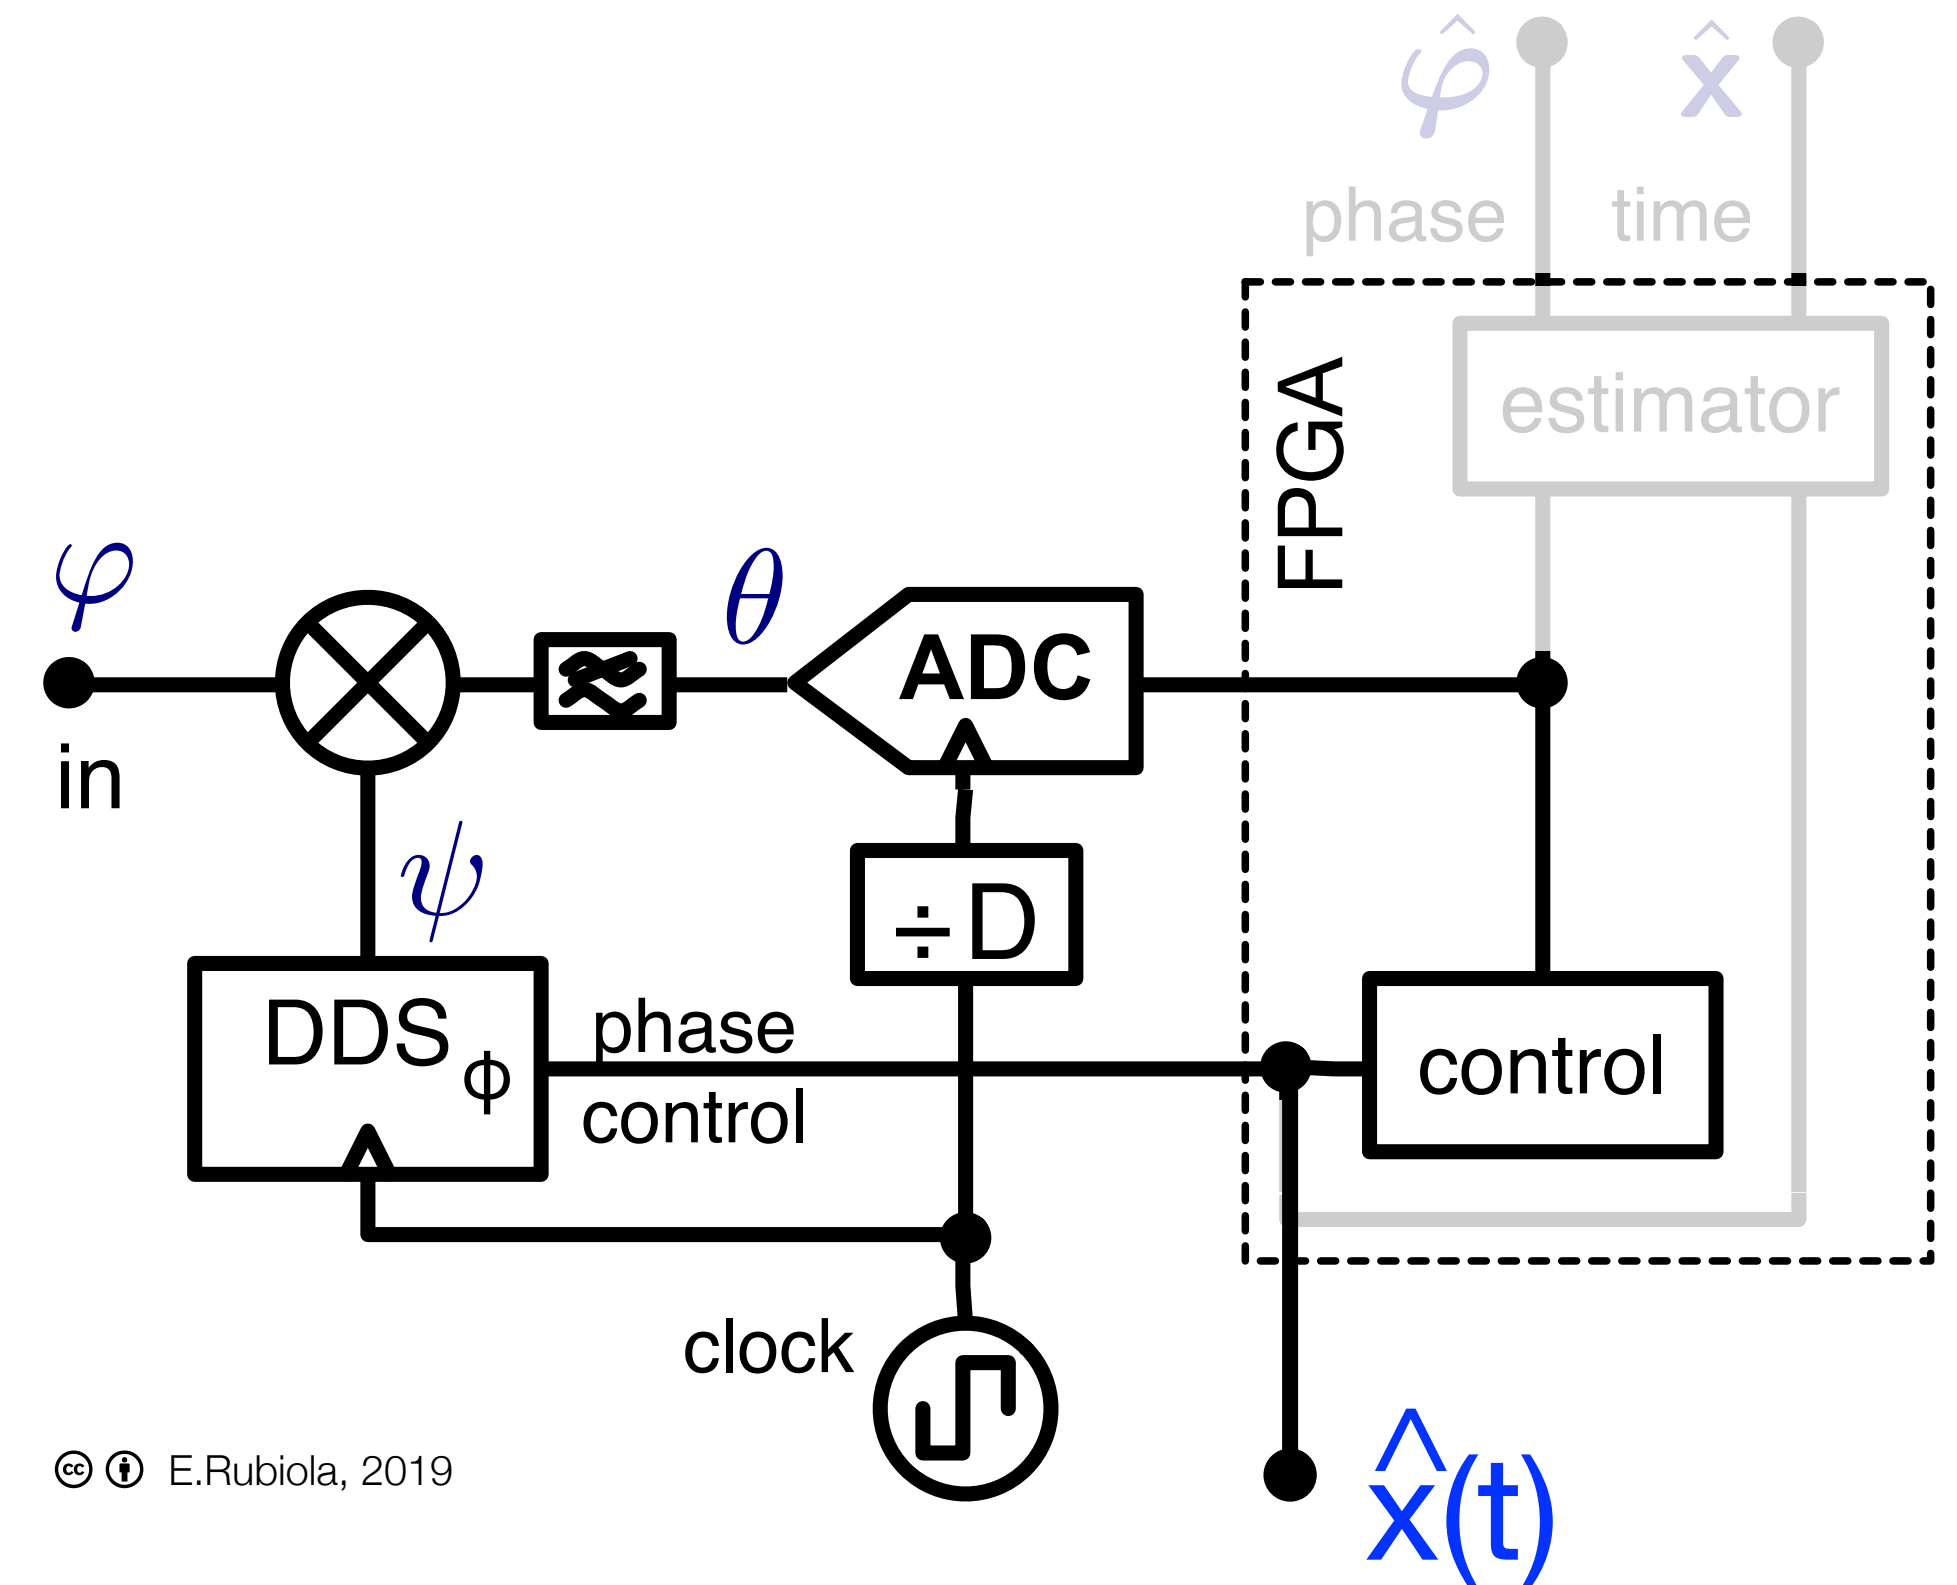

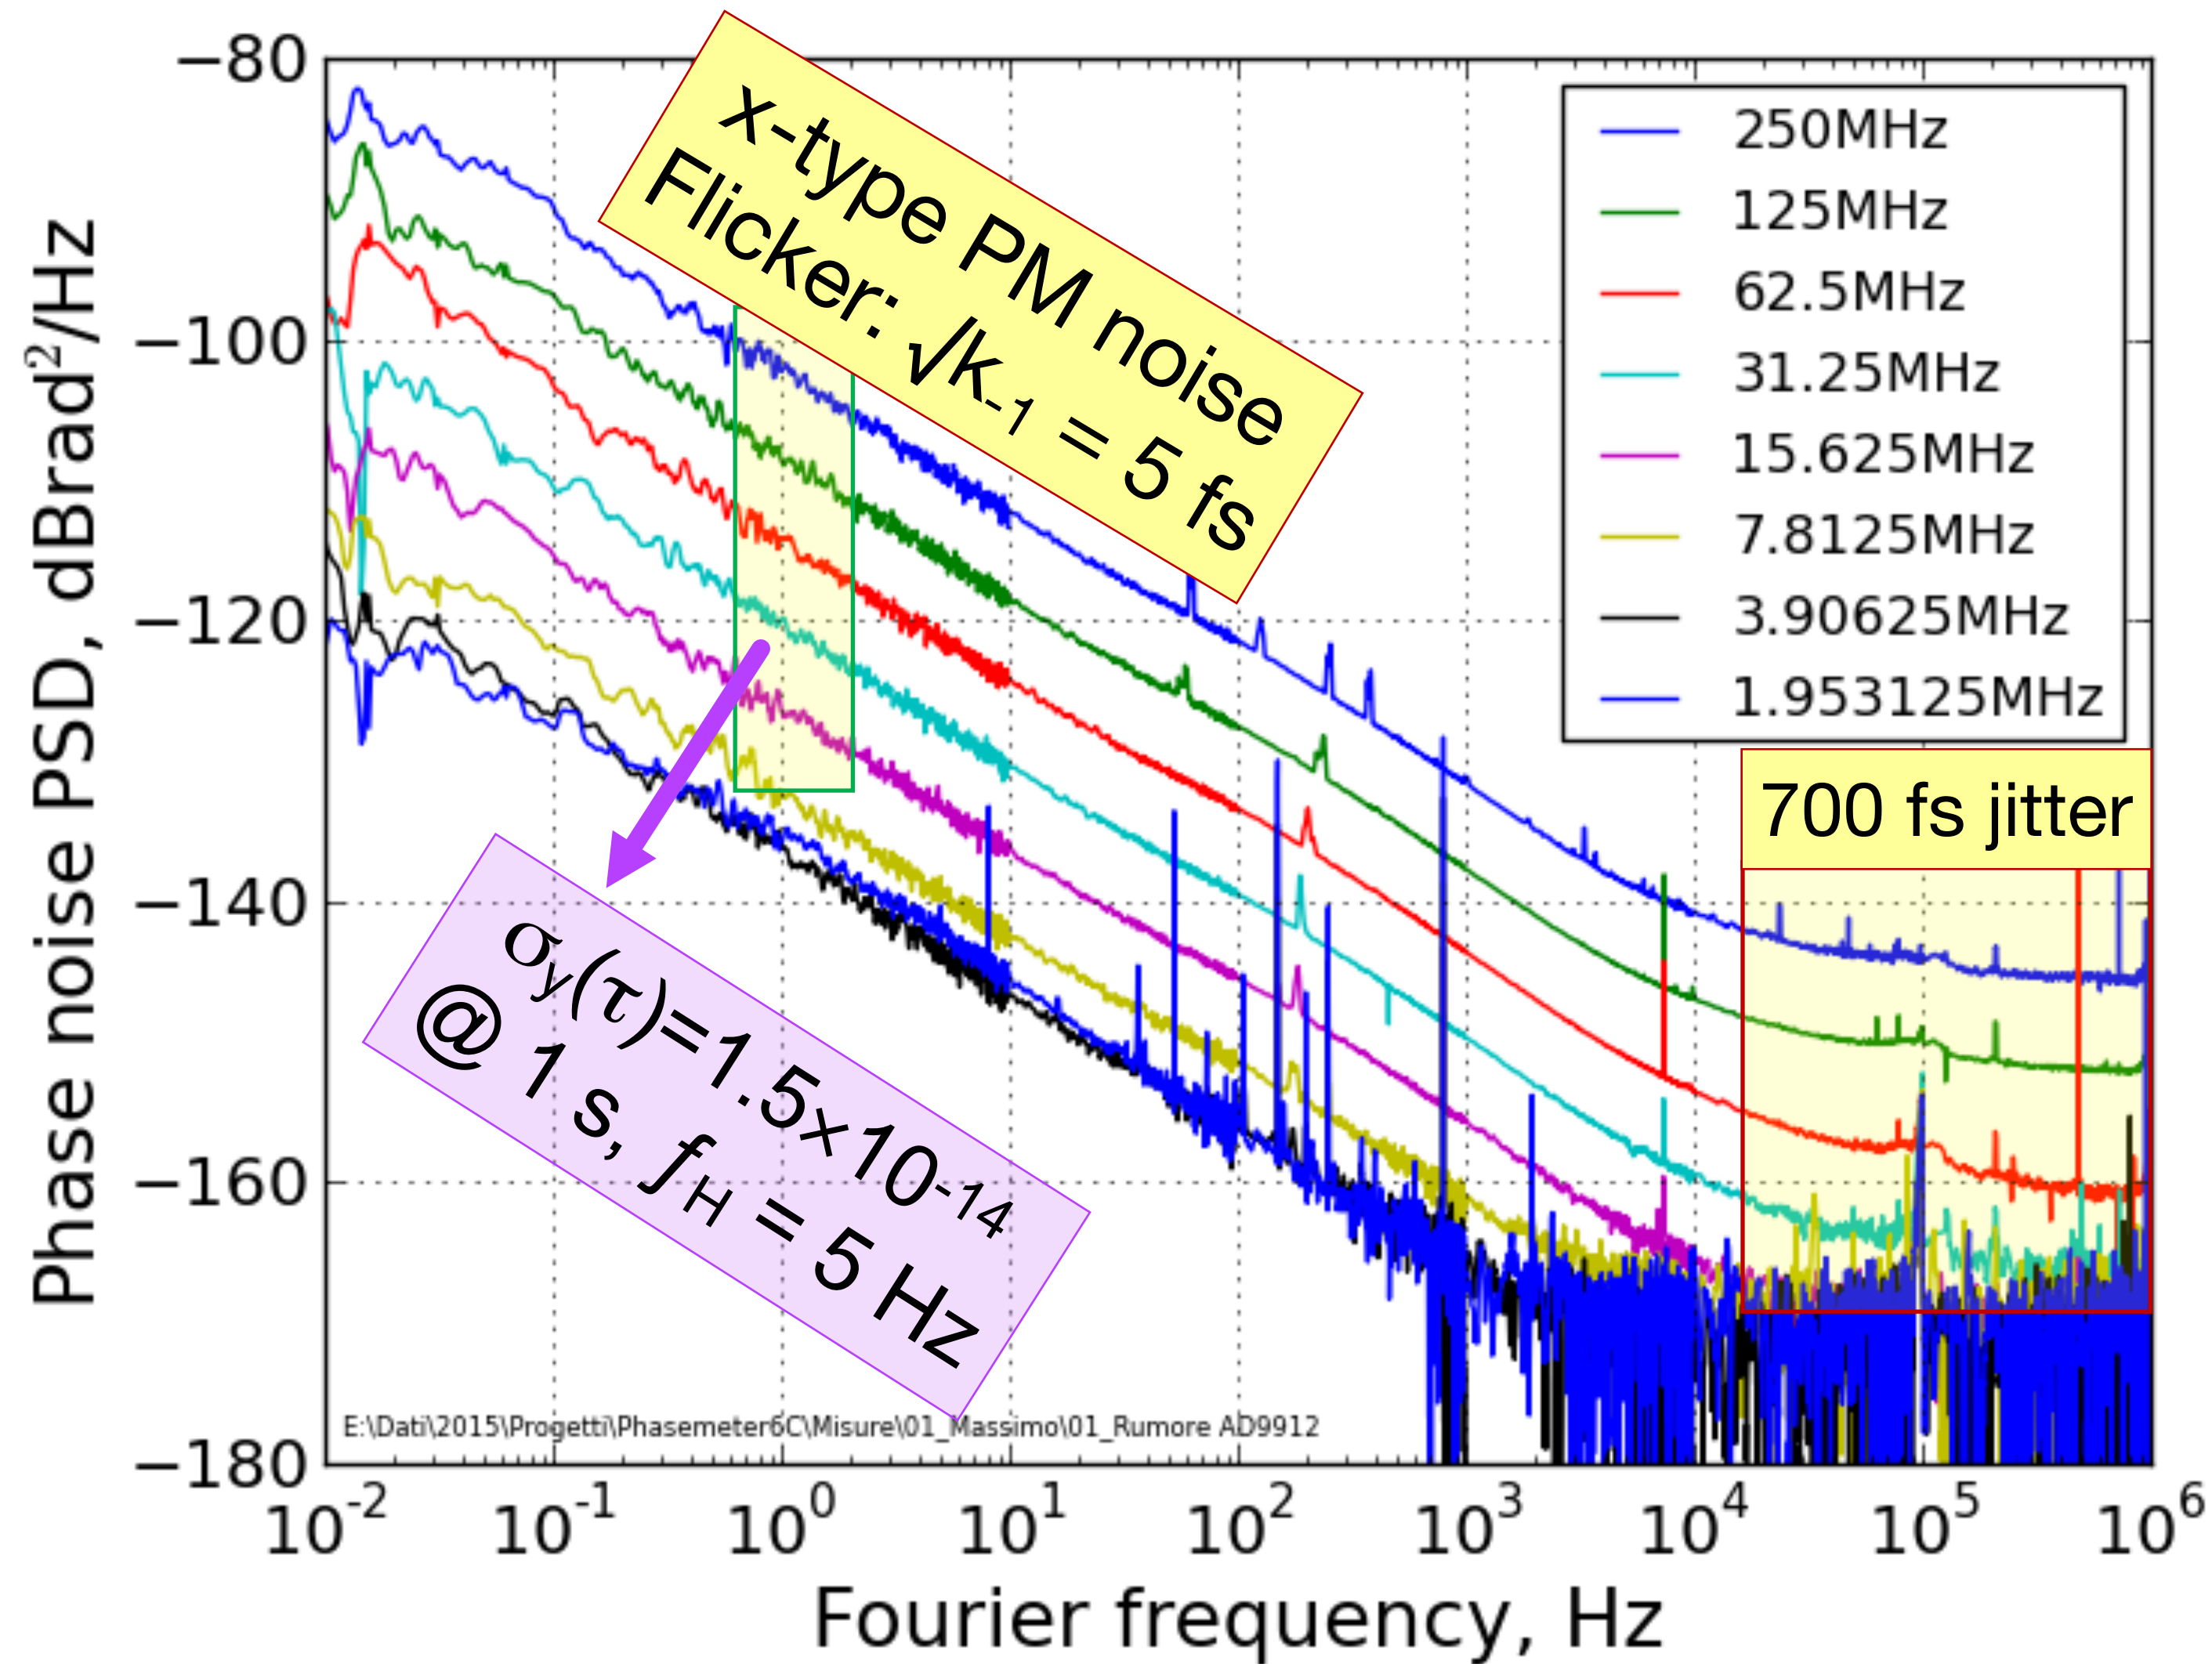

Trivial estimator for slow sampling ( $f_s = 10 \text{ Hz}$ )

DDS Noise  $\rightarrow$  C. E. Calosso, Y. Gruson, E. Rubiola, Proc 2012 IFCS p.777-782

TDDS  $\rightarrow$  M. Calligaris, G. A. Costanzo, C. E. Calosso, Proc 2015 IFCS pp.681-683

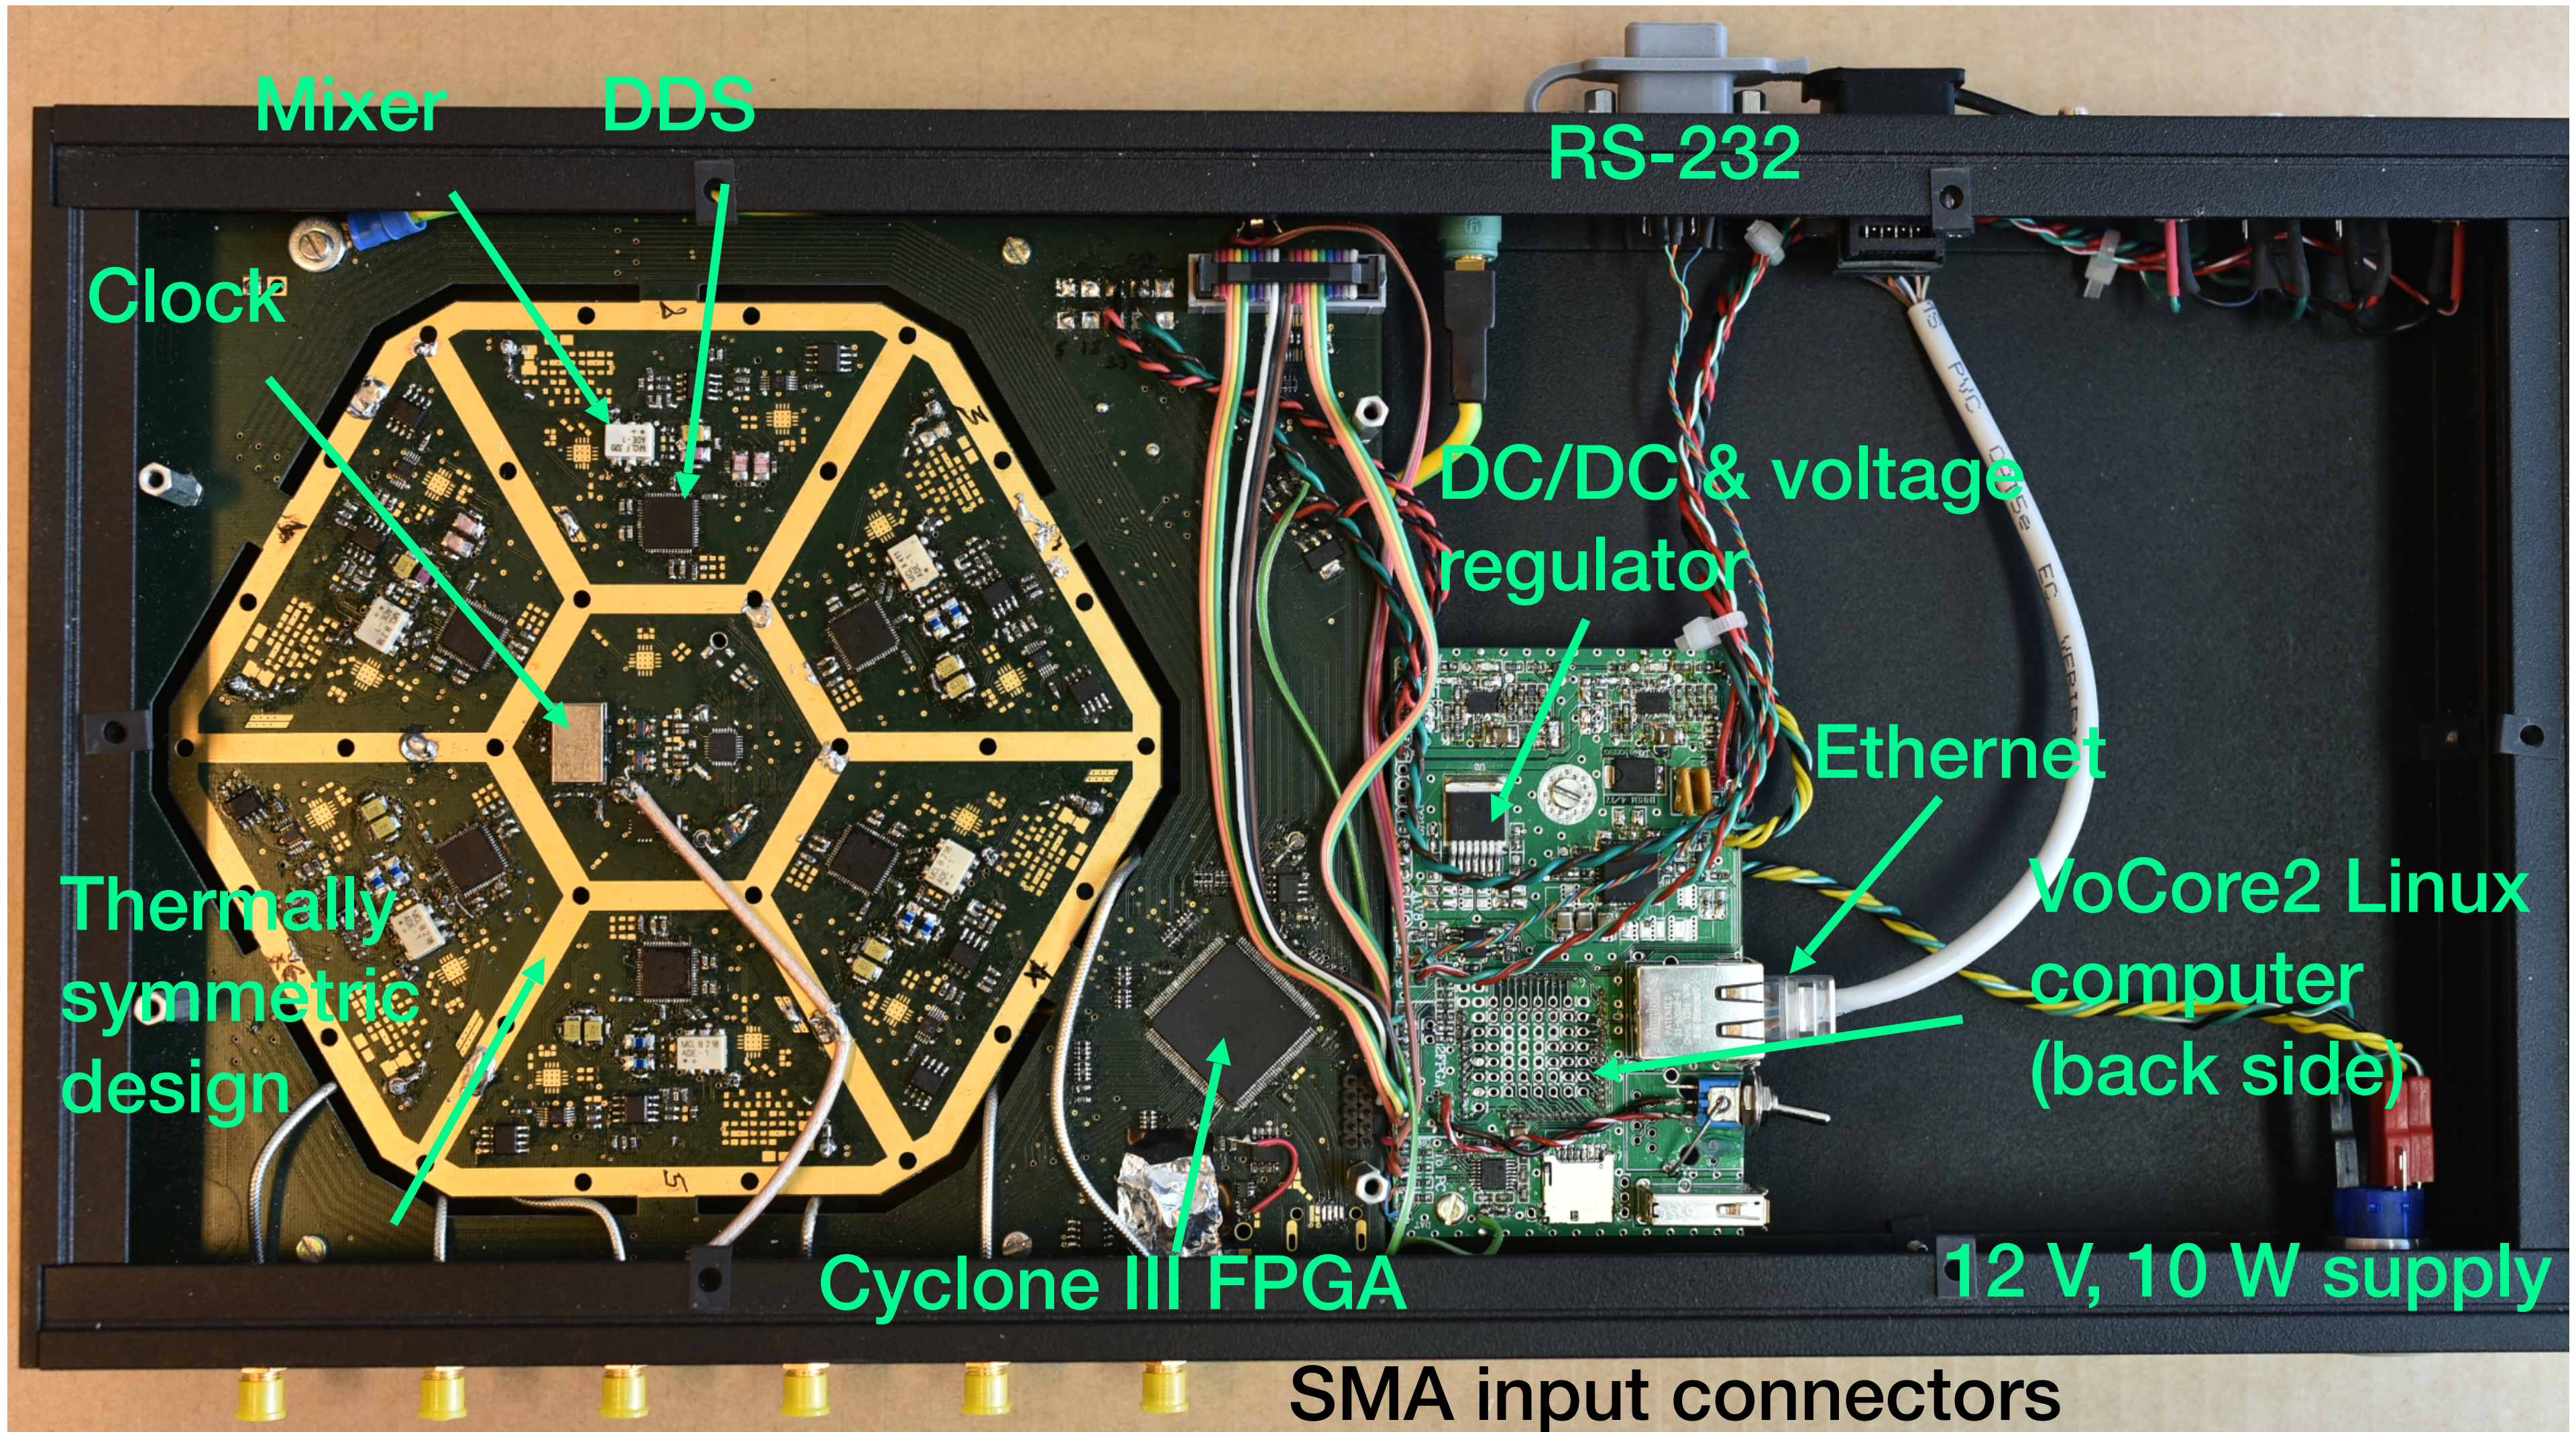

# AD9912 DDS: Time-Type Noise at $\geq 5$ MHz<sup>6</sup>

Trivial estimator for slow sampling ( $f_s = 10$  Hz)

# The 6-Channel TDDS

6 TDDSs, control unit, and interface in a small instrument

# Thermal Image

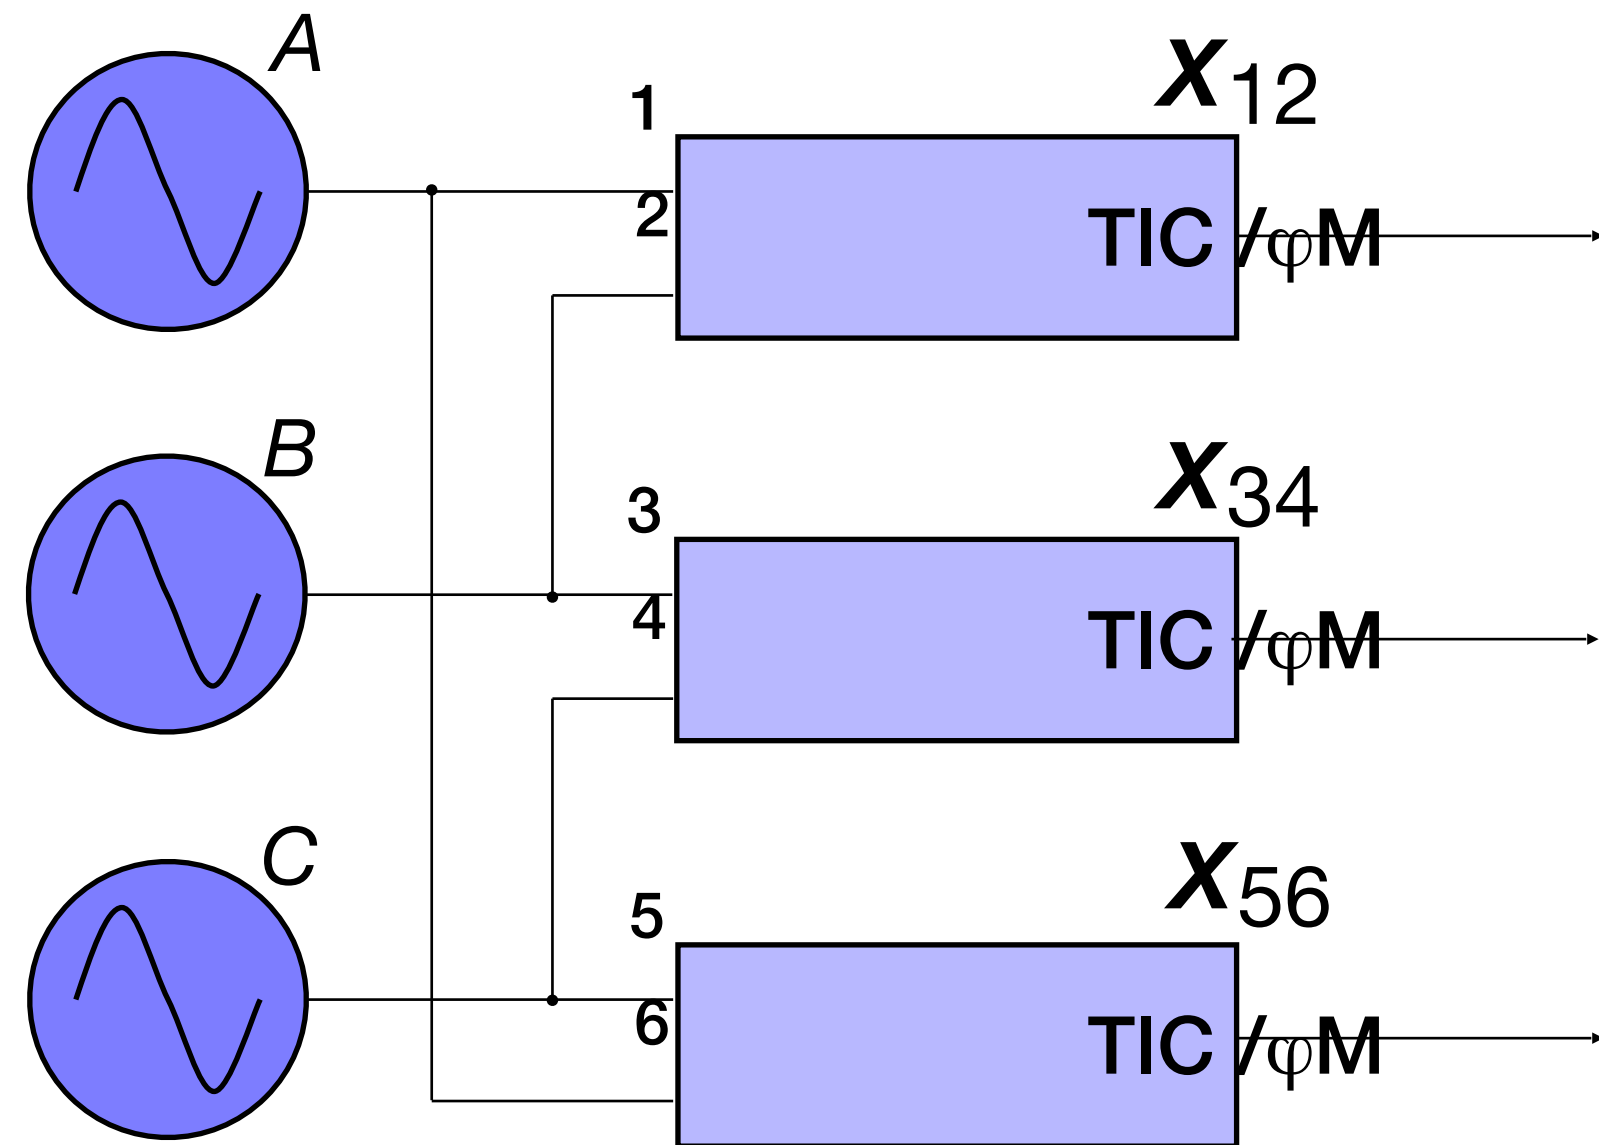

Small dissipation and thermal symmetry improve phase stability

# Statistics

## Time Interval Counters

$$x(t) = \frac{\varphi(t)}{2\pi\nu_0}$$

$$y(t) = \frac{dx(t)}{dt}$$

$$z(t, \tau) \equiv \frac{\bar{y}(t) - \bar{y}(t - \tau)}{\sqrt{2}}$$

$$z = \frac{x_2 - 2x_1 + x_0}{\sqrt{2} \tau}$$

## Oscillator Instrument

Single Delta		Single Delta		Noise
$x_B$	$x_{BA}$	$x_2$	$x_{21}$	$x_{n21}$
$y_B$	$y_{BA}$	$y_2$	$y_{21}$	$y_{n21}$
$z_B$	$z_{BA}$	$z_2$	$z_{21}$	$z_{n21}$
$\sigma_B^2$	$\sigma_{BA}^2$	$\sigma_1^2$	$\sigma_{21}^2$	$\sigma_{n21}^2$
$\sigma_{B,A}$				

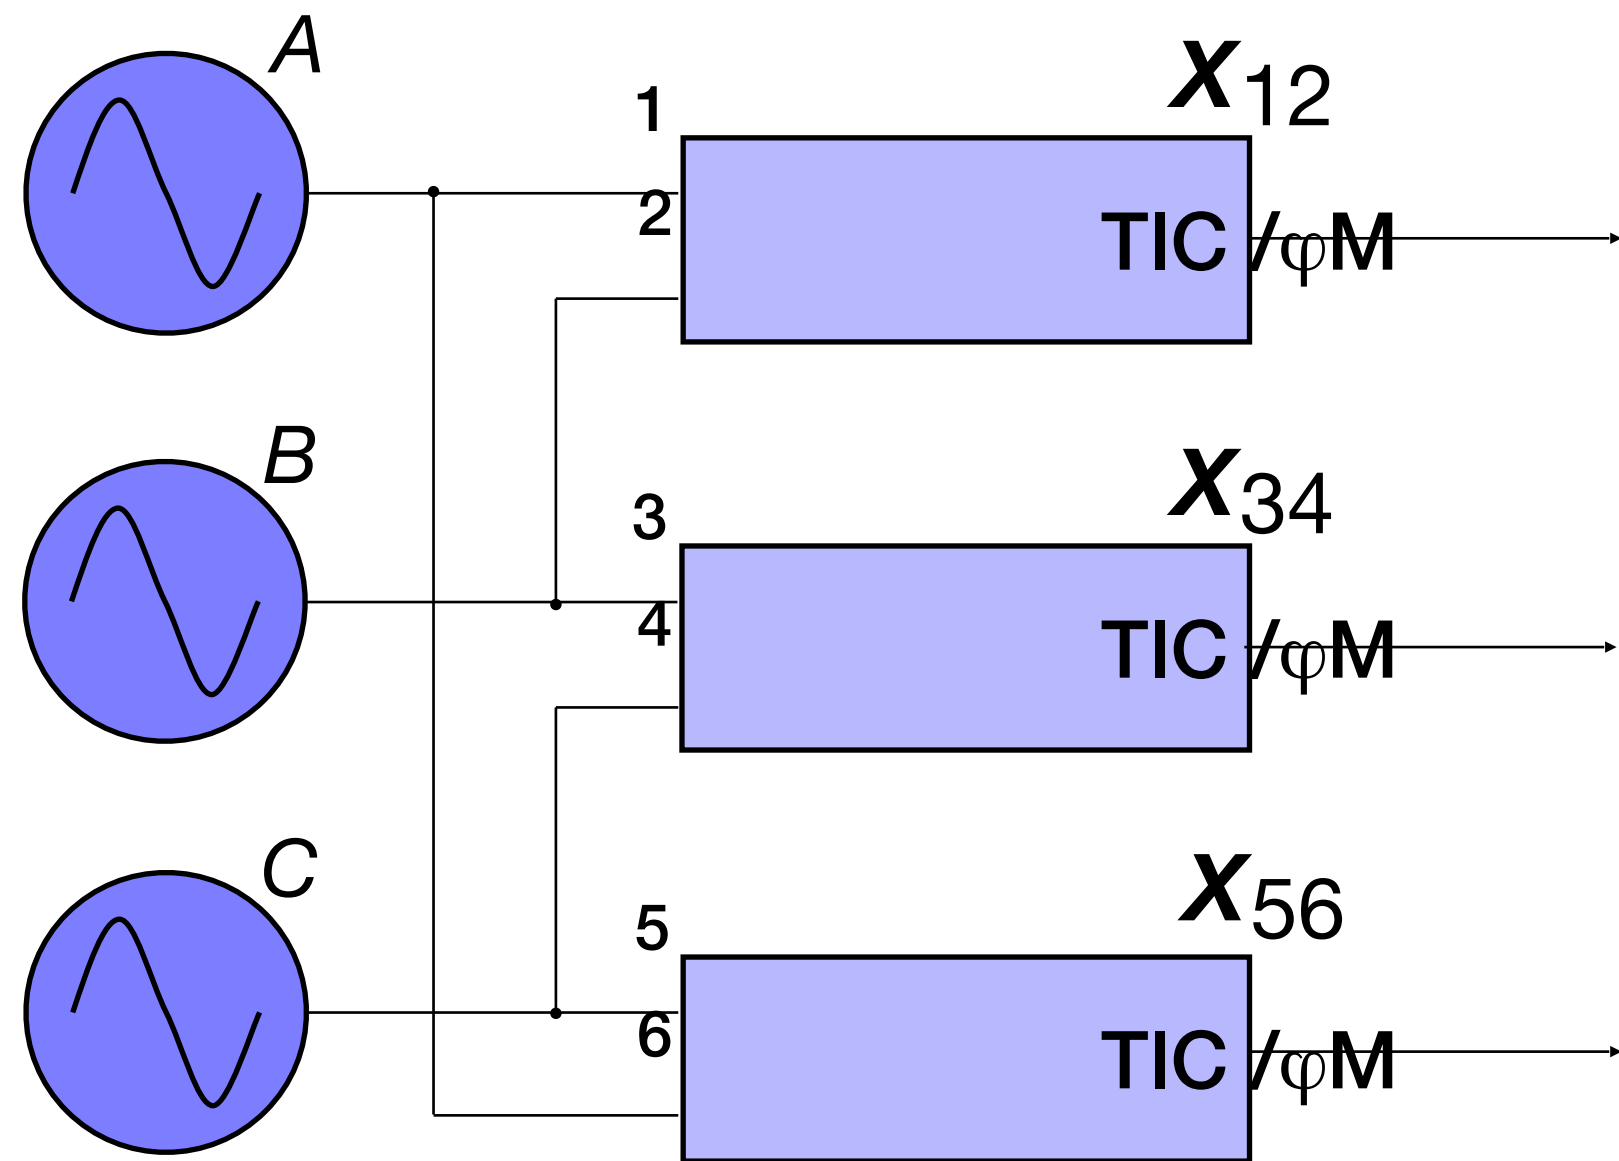

### AVAR

$$\sigma_y^2(\tau) = E[z^2]$$

### 2-Sample COV

$$\sigma_{y_A, y_B}(\tau) = E[z_B z_A]$$

# Statistical Tools

**3-cornered hat with  
noise-free instruments**

$$\begin{cases} \sigma_{AB}^2 = E[z_{12}^2] \\ \sigma_{BC}^2 = E[z_{34}^2] \\ \sigma_{CA}^2 = E[z_{56}^2] \end{cases} \Rightarrow \sigma_B^2 = \frac{1}{2} E[z_{12}^2 + z_{34}^2 - z_{56}^2]$$

**Noisy Instruments**

**3-Cornered Hat**  $\frac{1}{2} E[z_{12}^2 + z_{34}^2 - z_{56}^2] = \sigma_B^2 + \frac{1}{2} [\sigma_{n12}^2 + \sigma_{n34}^2 - \sigma_{n56}^2]$

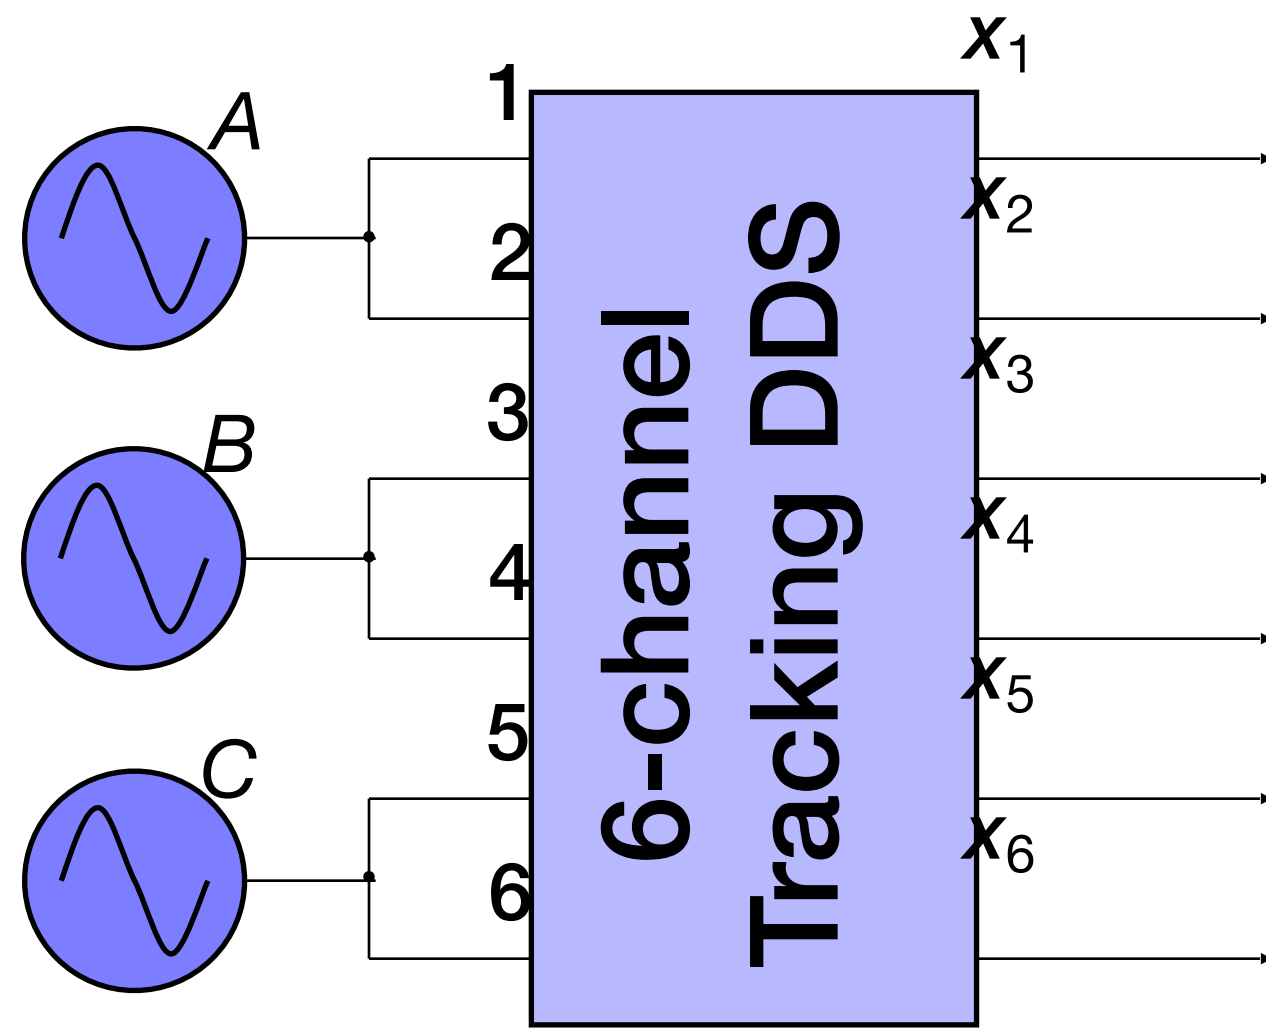

background noise  $\rightarrow 0$

**2-Sample COV**  $E[z_{21}z_{34}] = \sigma_B^2$

**At 100 MHz the Time Interval Counter is not an option**

# 2-Sample COV with TDDDS

Channels remapping  $\sigma_B^2 = E[z_{32}z_{45}]$

- Expand all terms
- Look at convergence laws
- Room for improvement

First improvement

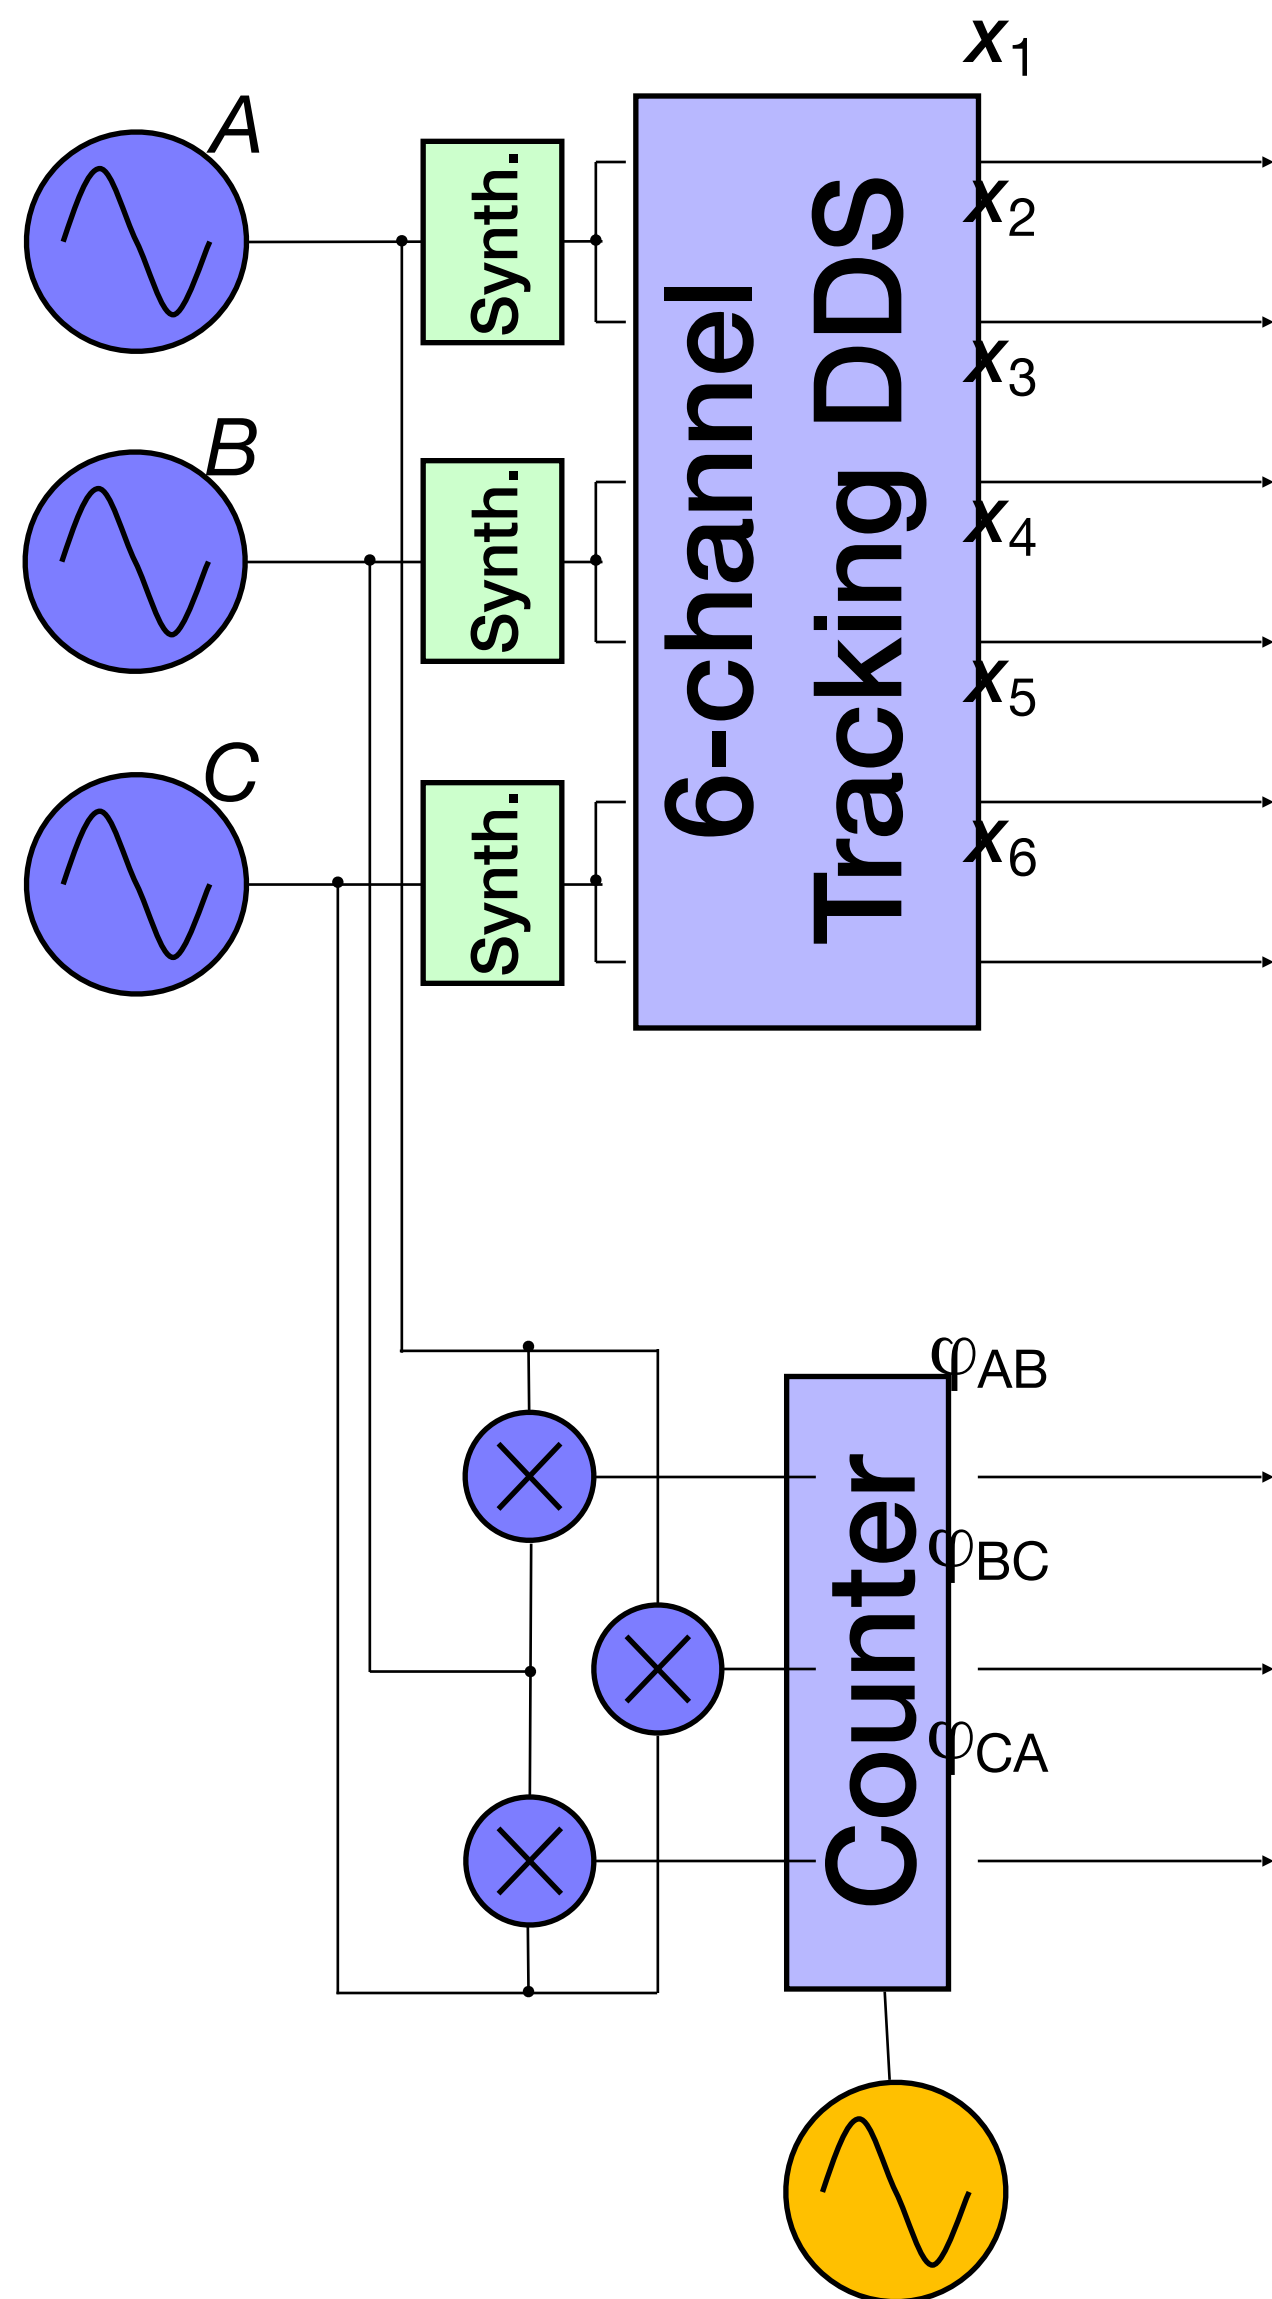

$$\sigma_B^2 = E[z_{3\langle 12 \rangle} z_{4\langle 56 \rangle}] \leftarrow z_{i\langle jk \rangle} = z_i - \frac{z_j + z_k}{2}$$

Second improvement

We use this  $\rightarrow$

$$\sigma_B^2 = \frac{1}{2} E[z_{3\langle 12 \rangle} z_{4\langle 56 \rangle} + z_{4\langle 12 \rangle} z_{3\langle 56 \rangle}]$$

# Experiment

## 2-sample COV (new)

- INRIM 6-Ch TDDS
- 100 MHz outputs
- 2-sample covariance

## 3-cornered hat classical)

- Lange / K&K counters
- 10 GHz outputs
- Different beat notes prevent crosstalk

Proportional-Integral control  
22±0.5 °C, <0.2 °C/H  
50±10% Hygrometry

control electronics

# Time Domain and ADEV

Overlapping Allan Deviation

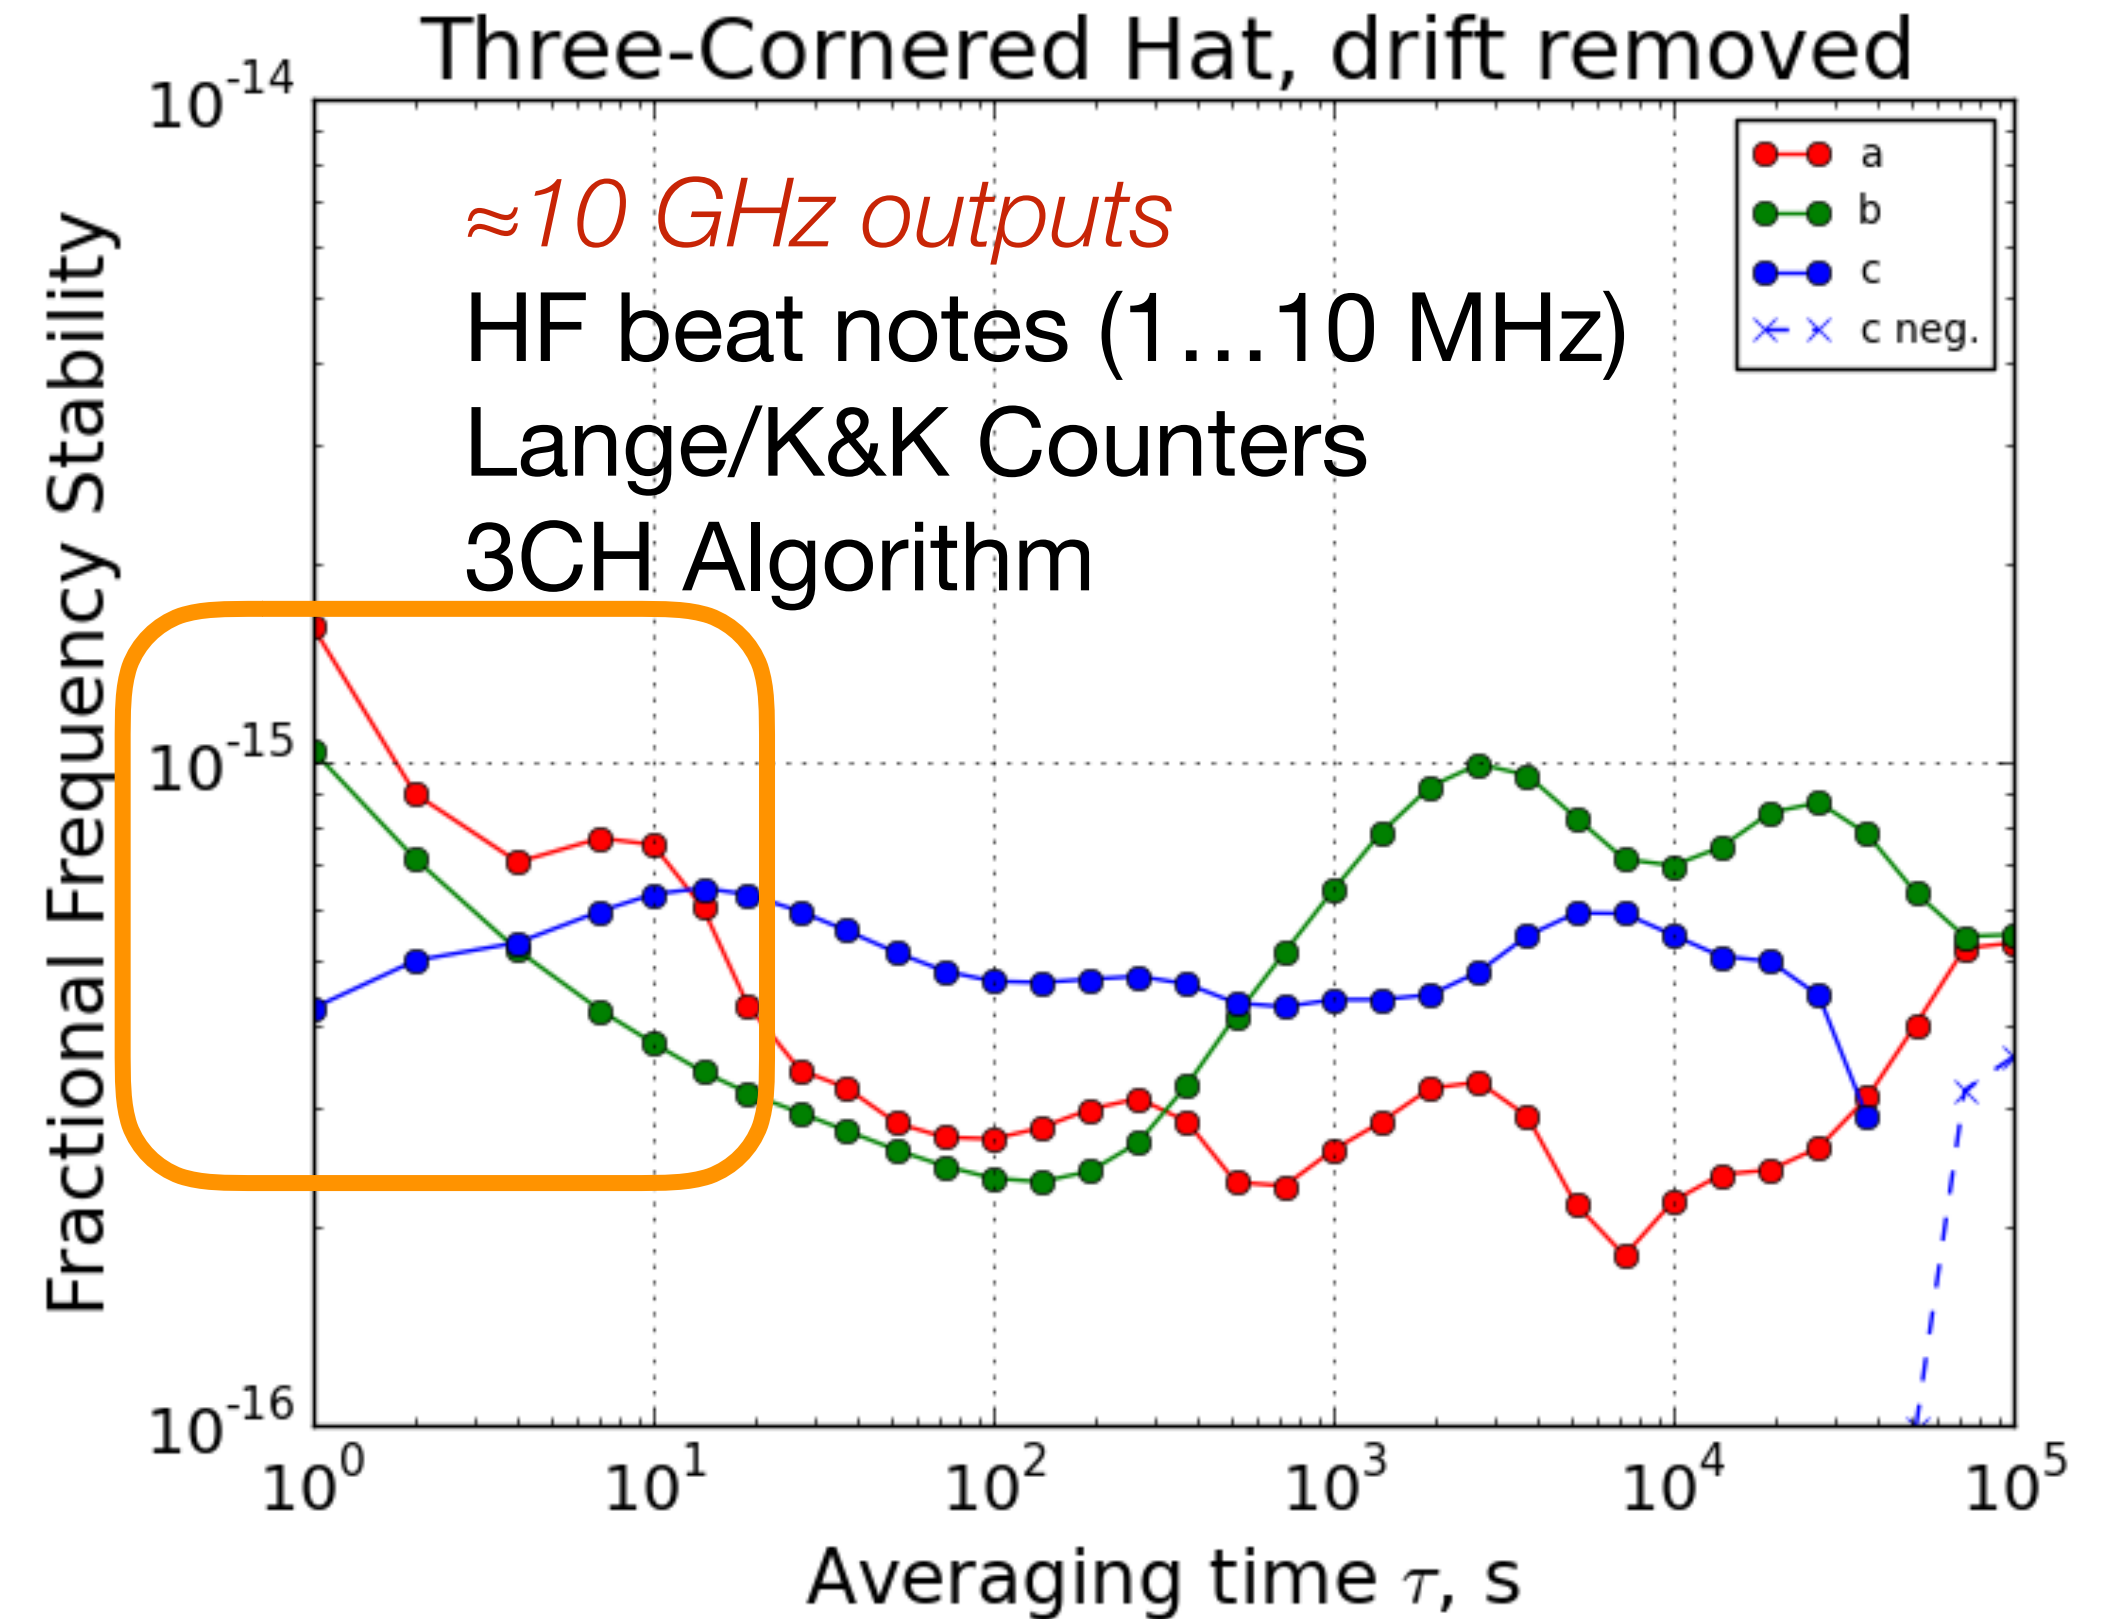

# 2-COV vs 3-CH

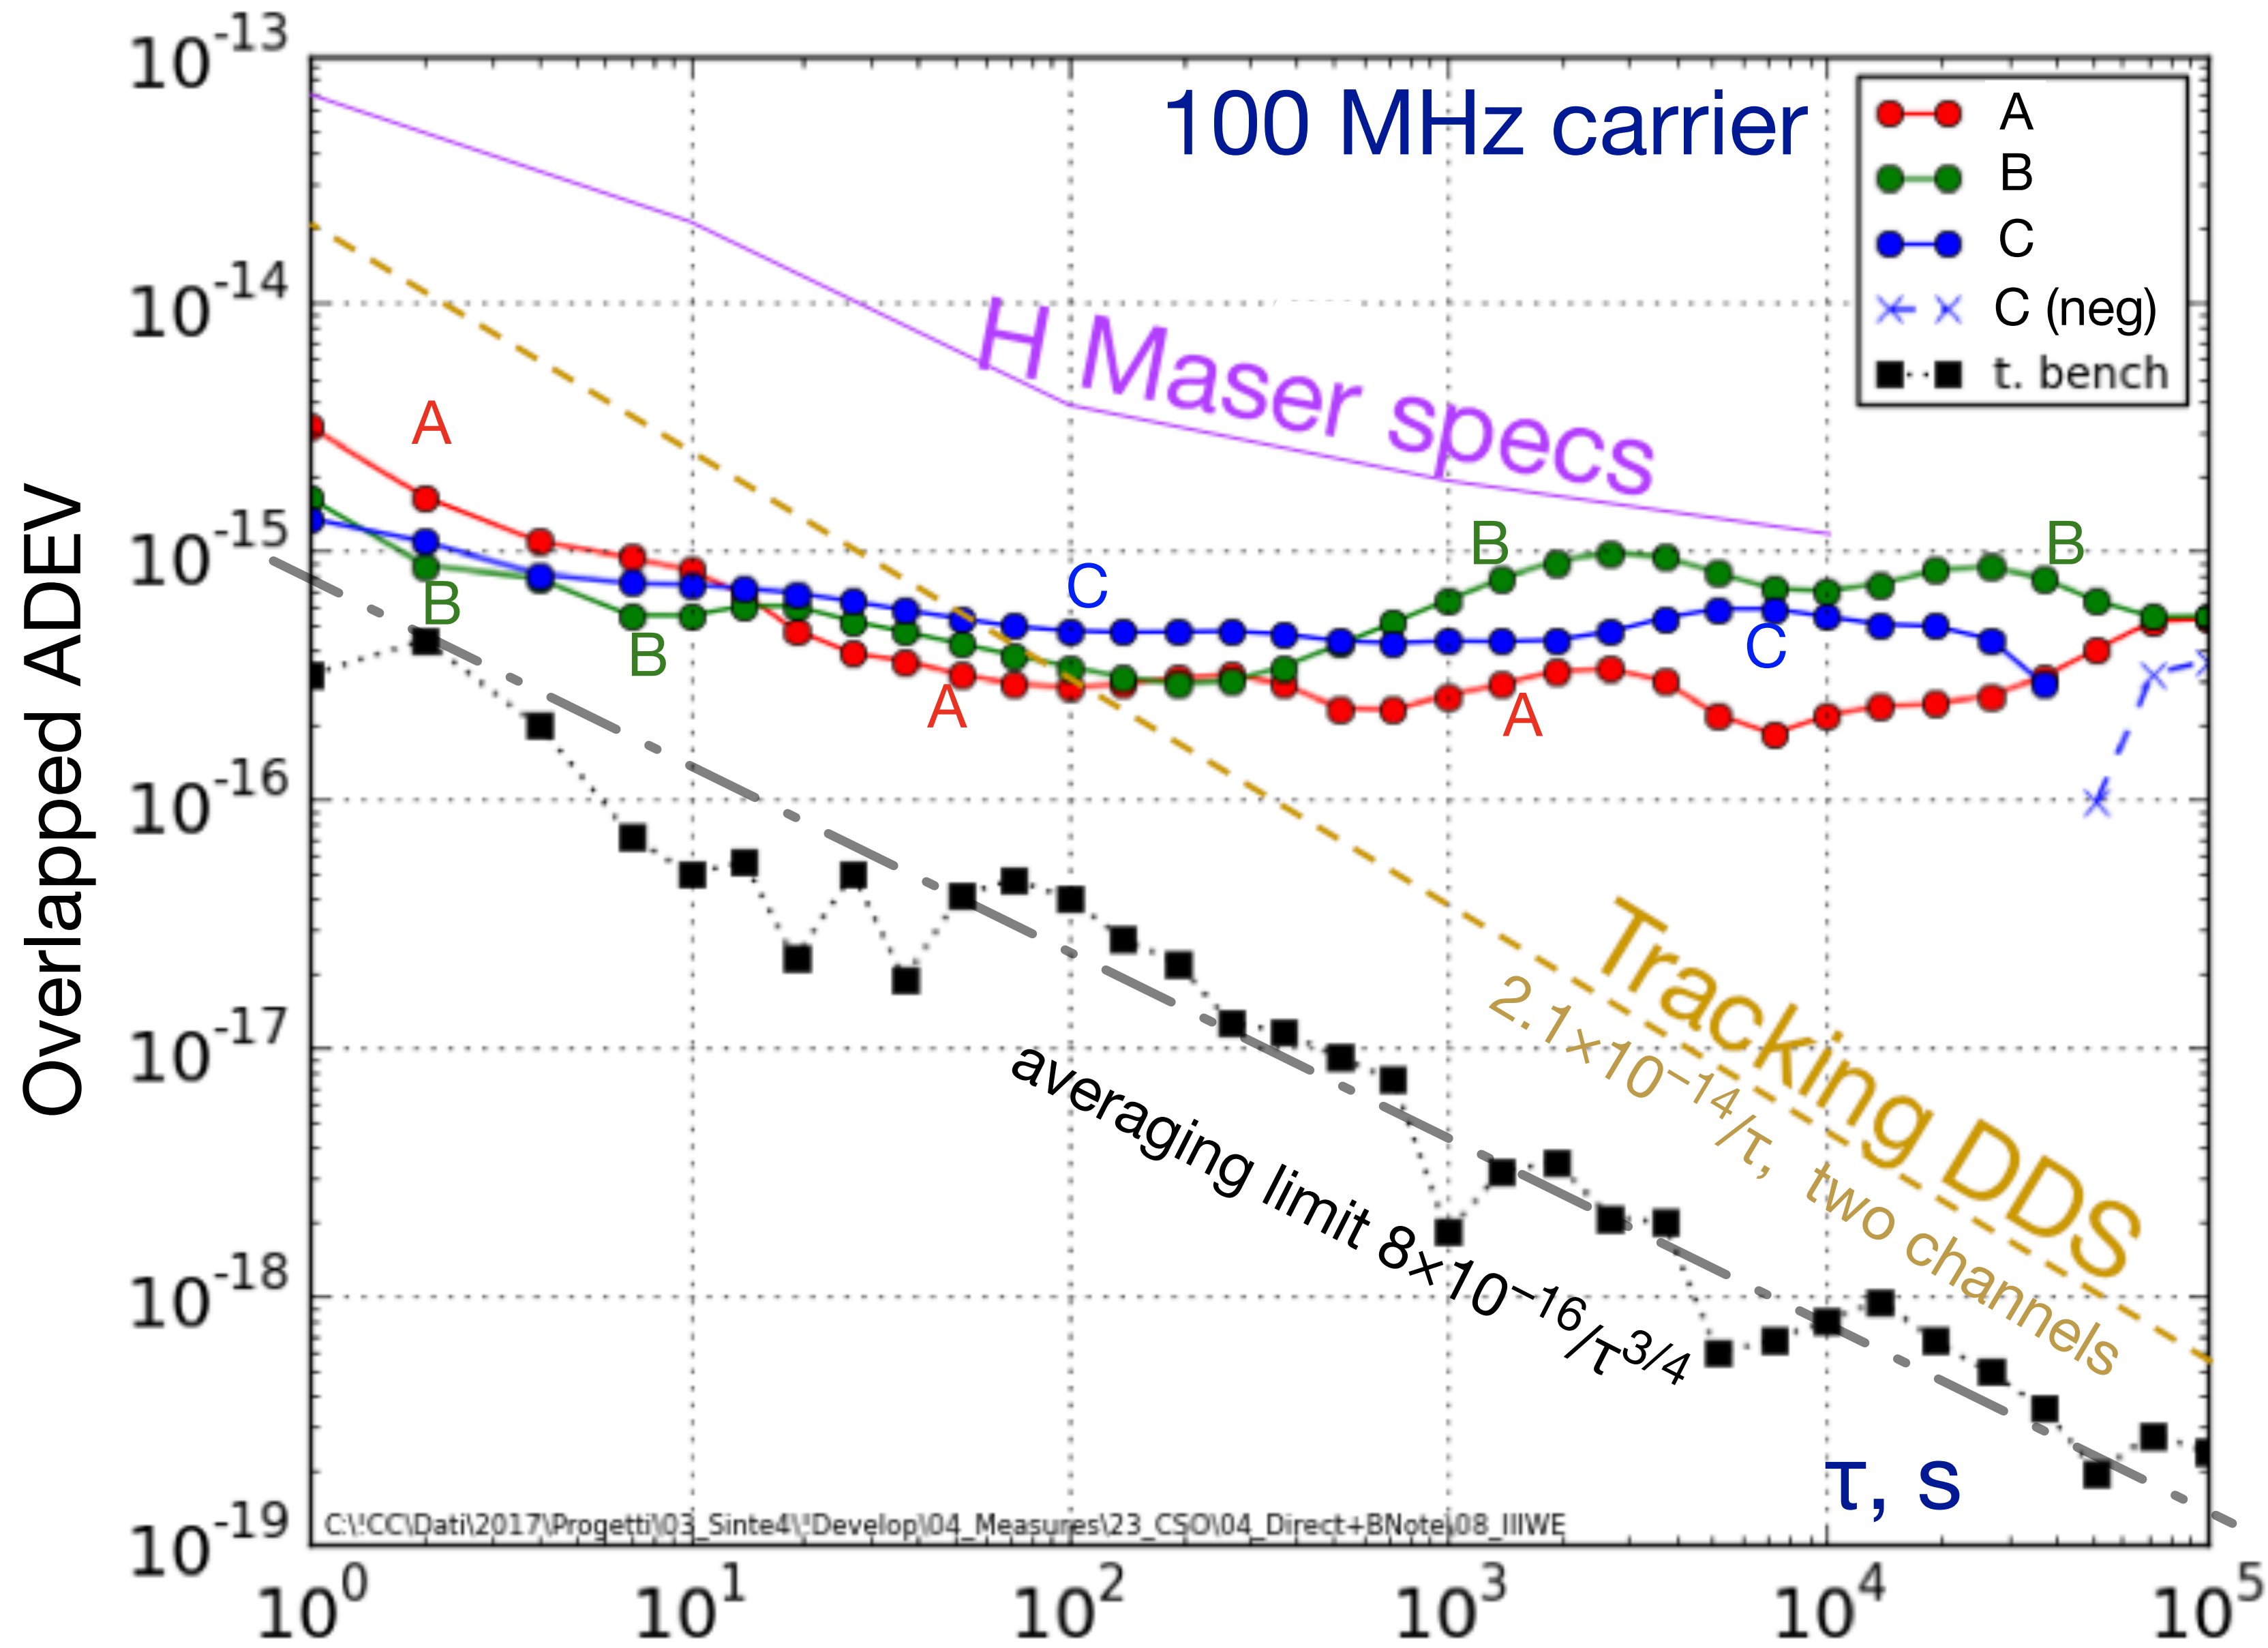

10GHz  $\rightarrow$  100 MHz synthesizer  
affects short-term ( $\leq 100$  s) stability

2COV algorithm and 3CH  
give the same result

# Conclusions (1)

## Achieved

- Full validation of the 100 MHz output
- 5–400 MHz TDDS range

## New TDDS in progress

- 12 channels
- Composite clock,  $2 \times 10^{-14} / \tau$  DDS limit
- Cable-length compensation at the output

# Conclusions (2)

## Oscillator

- A probe for the Solar System and for Fundamental Science
- A (traveling) standard of ADEV

## TDDS

- Defines the state of the art in the measurement of ADEV
